In our issue for November 28th we shall publish a special article on

NEW BUILDINGS IN GLASGOW,

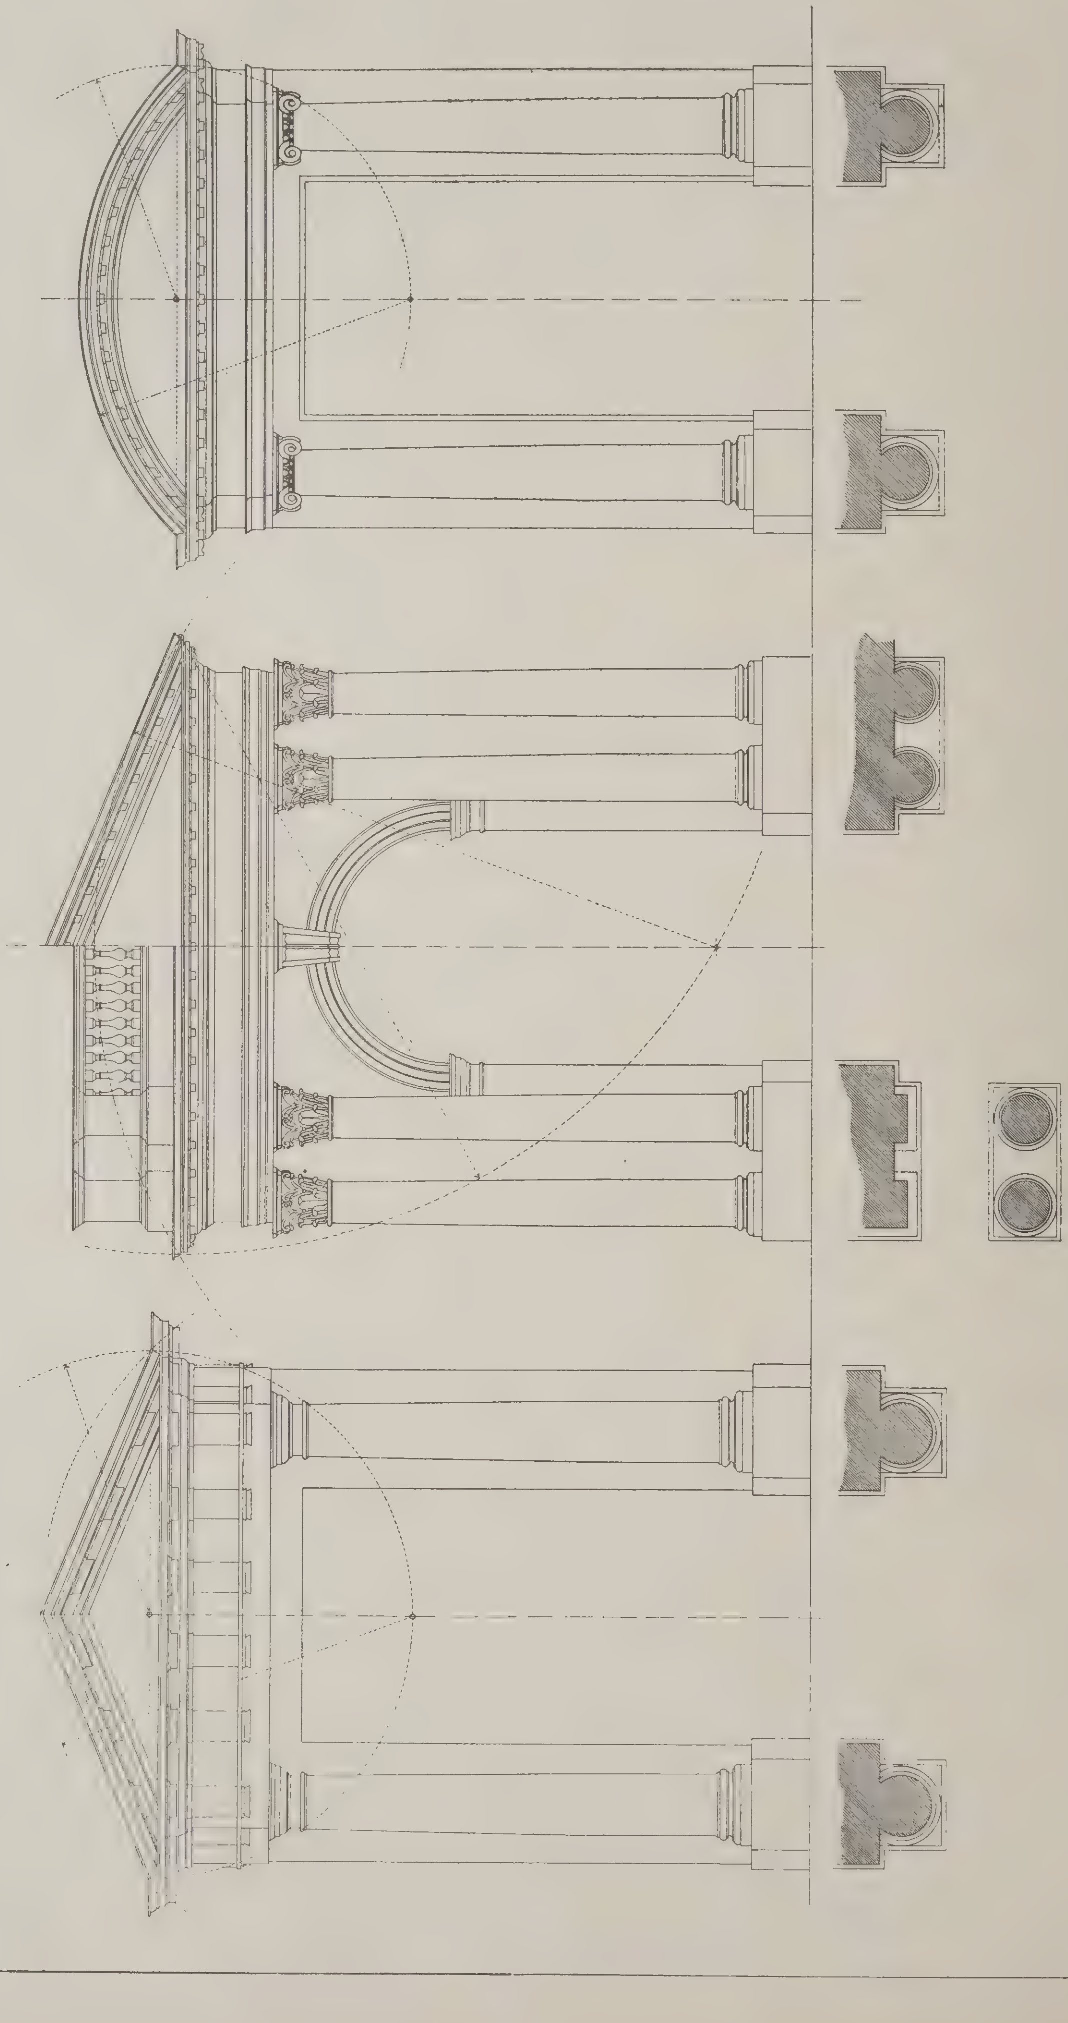
which will be illustrated by a large number of photographs and drawings.

No Hope in the Strand. NOBODY can say that a determined effort has not been made to get an alteration effected in the northern frontage of the Strand between Wellington Street and St. Clement Danes. Mr. Thornycroft first took up the matter three years ago, and he has been strongly supported by the Further Strand Improvement Committee, the Royal Institute of British Architects, the Royal Academy, the Surveyors' Institution, and a host of distinguished memorialists. But the Improvements Committee of the London County Council has not budged from the position which it took up at the start. It assures us that it has given "most anxious consideration" to the matter, and "the fullest weight" to the views of the distinguished memorialists, but it comes back always to the financial argument. It has had a number of calculations worked out as to what the Council would stand to lose if the proposal were carried out, and these figures of course show a very large loss of revenue. The broader aspect of the question—namely, the great civic improvement to be effected—seems to have no appeal to the Committee, which is all for cutting down expenses. In this connection it is rather amusing to compare the present parsimony in respect of a great street improvement with the wanton extravagance on steamboats, for instance. The memorialists, of course, want a piece cut off the island site in order to gain a finer architectural vista, but the Improvements Committee assure us that even if a strip 6ft. wide were taken off from Aldwych, tapering away for 255ft., the cost of altering the Strand frontage would be about £35,000 in respect of land alone. The Committee's argument is, that the width of the Strand at this point is now 100ft., while Fleet Street as widened at the eastern end by the City Corporation is only 60ft., and the widened portion of the Strand by the Hotel Cecil only 80ft., and this fact urges the Committee to take still greater refuge in its financial opinion. Moreover, it is not convinced that the architectural effect in the Strand would be improved if the proposal were carried out, and it therefore does not feel justified in recommending the Council to adopt the proposal. Doggedly asserting its original opinion, we suppose now nothing further will be done.

Refinements and Irregularities in Architecture. THE researches which Prof. Goodyear has made in connection with irregularities in medieval churches and cathedrals has led to a revival of interest in the subject, which is certainly of importance to architects. If we dismiss the conclusions arrived at by Prof. Goodyear, on the ground that many of the variations from mathematical exactitude in setting-out and detailing may have been caused by settlement or inability in the workmanship, there remain other examples of deliberate intention (such as Ruskin pointed out in "The Seven Lamps of Architecture") and these cannot be ascribed to any such causes: the only reason we can give for them is that they were refinements introduced by the designer in order to please his sense of fitness. Whether or not he succeeded in effecting an improvement is open to much doubt; indeed, medieval design does not show any strong evidences of success in this direction likely to help modern designers. It is true some of these accidental or intentional irregularities may give an interest to parts of a building, but the modern designer would not care to adopt such methods as those indicated. The argument for the introduction of refinements must be based chiefly upon examples of Classic architecture. In the Renaissance, mathematical exactitude seems generally to have been desired if not obtained. Roman work seems to be regarded as ruder, and unlikely to contain refinements, although Vitruvius makes some remarks abcut curves in horizontal lines in buildings. The exponents of the theory of refinements in ancient architecture lay chief emphasis on Grecian work. It is unquestionable that Greek builders were able to work with very great exactitude, and, reasoning from this, Cockerell, Pennethorne, Penrose and others concluded that the refinements they discovered were the result of some mysterious ingenuity. Regarding them, however, in the light of later knowledge and from a common-sense appreciation of ordinary building operations, it seems fairly plain that any refinements introduced were the result on the one hand of what might be called freehand drawing or modelling in the round, and on the other of traditional methods. Admitting that the Greeks introduced refinements, it is very doubtful whether these were all such decided improvements in the architectural appearance, because the remains of their buildings are so incomplete and have suffered so much from the effects of time that their beauty depends more upon accidental than upon designed effects. If we could see these Greek buildings in their newness they would probably strike us as rather hard and garish. Some of these refinements, such as the convexity of steps and entablatures and other long horizontal lines, undoubtedly correct the optical illusion of sagging, while the entasis on the column may partially have the same effect. The theory of visual correction is, however, insufficient to account for the considerable curvature which was given to the entasis of columns and to horizontal lines. This can easily be overdone, as we often see in modern buildings. The Greek architect undoubtedly looked upon his building with the eye of a sculptor, and his refinements were the result of a difference in the system of designing, whereby he worked in the solid materials rather than upon paper, as we do.

DOORWAYS AND PEDIMENTS

PLATE 7.



THE ORDERS AND THEIR APPLICATION. BY ALFRED W. S. CROSS, M.A., F.R.I.B.A., AND ALAN E. MUNBY, M.A.

PRACTICAL NOTES FOR ARCHITECTURAL DRAUGHTSMEN.

By Alfred W. S. Cross, M.A., F.R.I.B.A. and Alan E. Munby, M.A,

THE ORDERS AND THEIR APPLICATION.

(Continued from p. 223, No. 613.)

Plate VII.

Doorways.

In considering the application of the Orders to doorways, the foregoing general principles regarding proportion must be retained. The scale of the embellishment employed, however, must always be subservient to that of the main composition, otherwise the continuity of the latter will be lost and confusion will result.

The height of the door aperture should never be less than twice its width, and generally a little more. In simple doorways, without columns, the area of the surrounding treatment may be about two-thirds the area of the opening; but where columns are used the former generally considerably exceeds the latter.

An inspection of the plate will show that with single columns the combined width of the two columns and their backing is about equal to the width of the aperture.

Where doors occur in colonnades, the top of the door cornice should range, if possible, with the top of the impost of the arch (if any).

If the columns are brought forward and flanked by pilasters to form a portico, as shown on the left hand of the centre illustration, a more massive treatment is generally advisable than that employed when the columns are engaged.

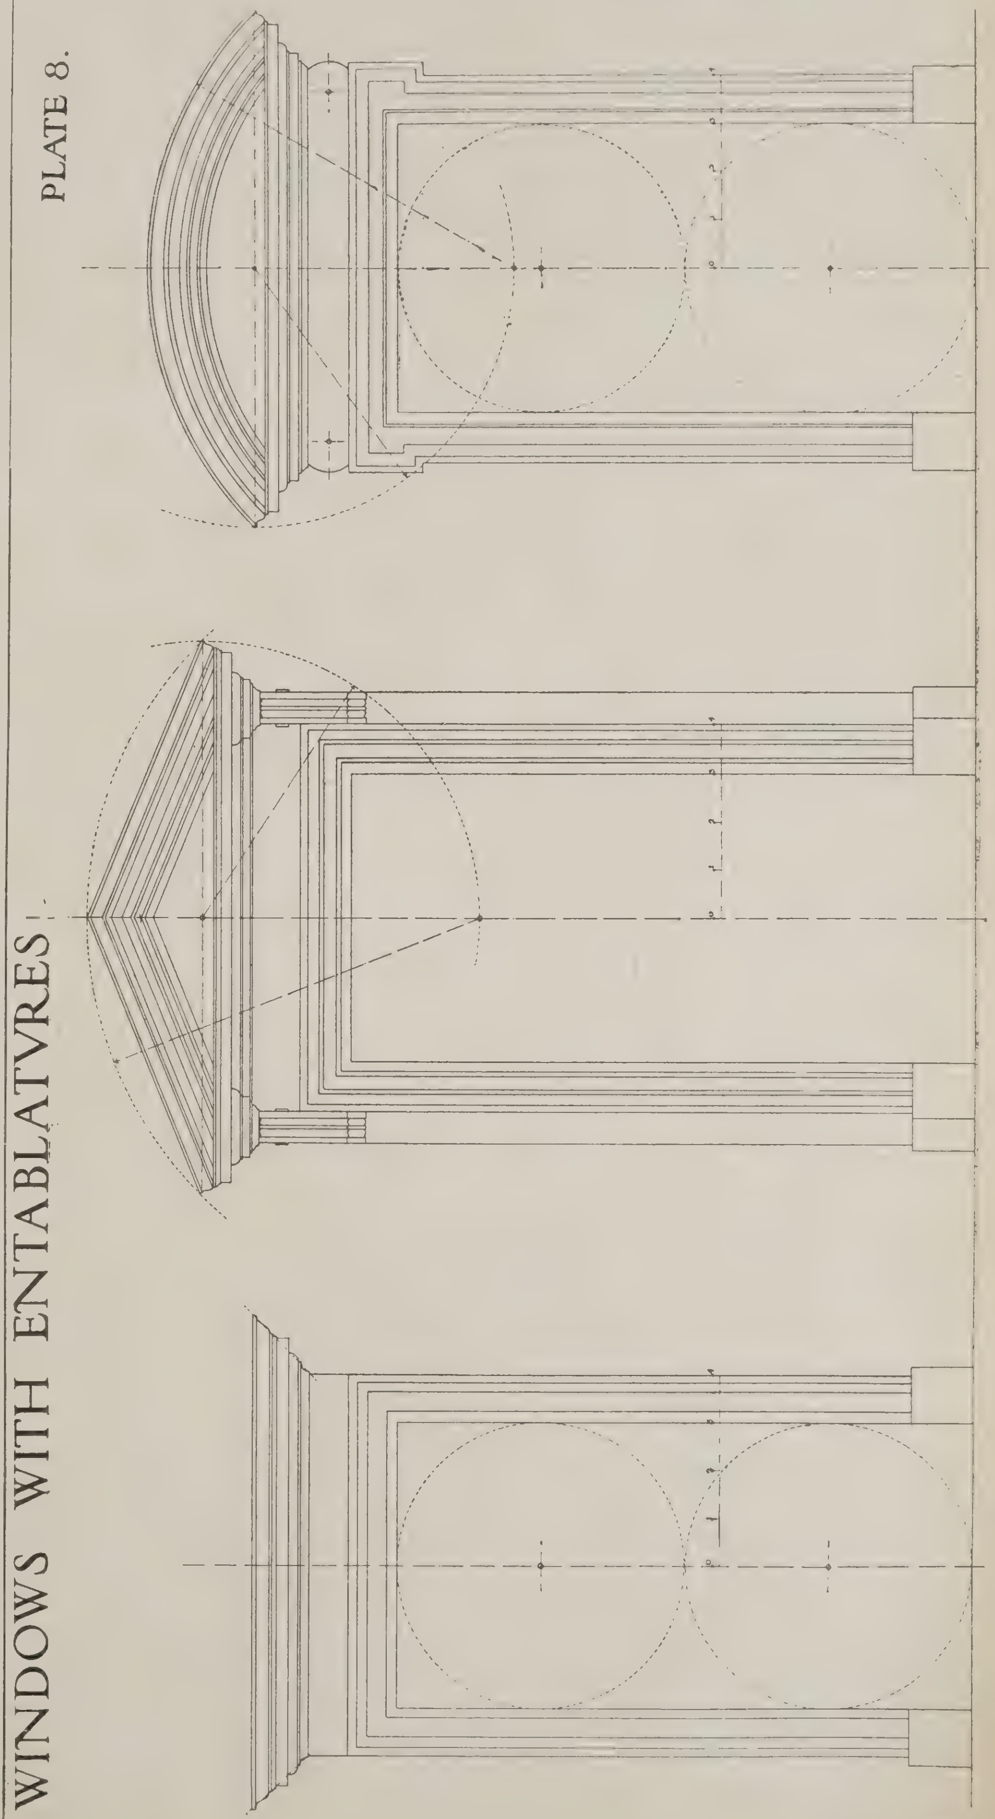
The doorway may be crowned by an entablature terminating in a horizontal cornice, or by a balustrade or pediment, as shown.

As pediments have not been previously referred to, the rules concerning their setting out may be here enumerated.

Rules for Setting Out Pediments.

When a pediment is used, the horizontal members of the entablature above the fillet of the corona are always omitted, except on the horizontal continuation of the cornice beyond the sides of the pediment. As the projection of the cyma is more marked on pediments than on a horizontal cornice it is desirable to use one with a moderate projection where these architectural features are employed. The cyma of the pediment should start from the horizontal fillet above the corona, the termination of which is found in the ordinary course of setting up the Order. All the members of the cornice should be repeated in the pediment, set out normally to the ratio or segment. Modillions and dentils should be set out vertically over those in the horizontal cornice, and their sides should be vertical, and not at right angles to the slope of the pediment. Similarly, the projection of the splay or moulding running round the modillions should be drawn vertically over those in the cornice below, and the rake or segment over each modillion found by connecting the points so obtained with the top of the modillion sides in the pediment. Some distortion of the mouldings at the base of the pediment is unavoidable, but usually, owing to the diminutive nature of the features affected, it is unimportant.

The pediment should be either an unbroken triangle or the segment of a circle. Its height must be correctly proportioned to the span of the composition. The rule for obtaining this height, as given by Gibbs, is shown upon the right and left-hand examples on this plate. A line through the centre of the doorway, at the height of the top of the horizontal cornice, is taken as a centre from which a circle is described, having a radius equal to the distance of the commencement of the rake of the top member of the pediment (as judged). The point at which this circle cuts the centre line of the doorway becomes the new centre from



which a radius, taken to the same point as before, gives an arc the summit of which is the top of the pediment.

Since this rule involves the use of a point which, strictly speaking, cannot be obtained until the rake of the pediment is known, the method given by Chambers seems to be preferable, as being less empiric while it is certainly equally simple. This is shown upon the centre example on the plate. With the whole length of the fillet over the corona as radius, and one end as centre, strike an arc to cut the centre line of the composition. With this point of intersection as the centre, and its distance to one of the extremities of the same fillet as the radius, draw an arc through the pediment. The point at which this arc cuts the centre line is the point of intersection of the *lowest* member of the pediment cornice.

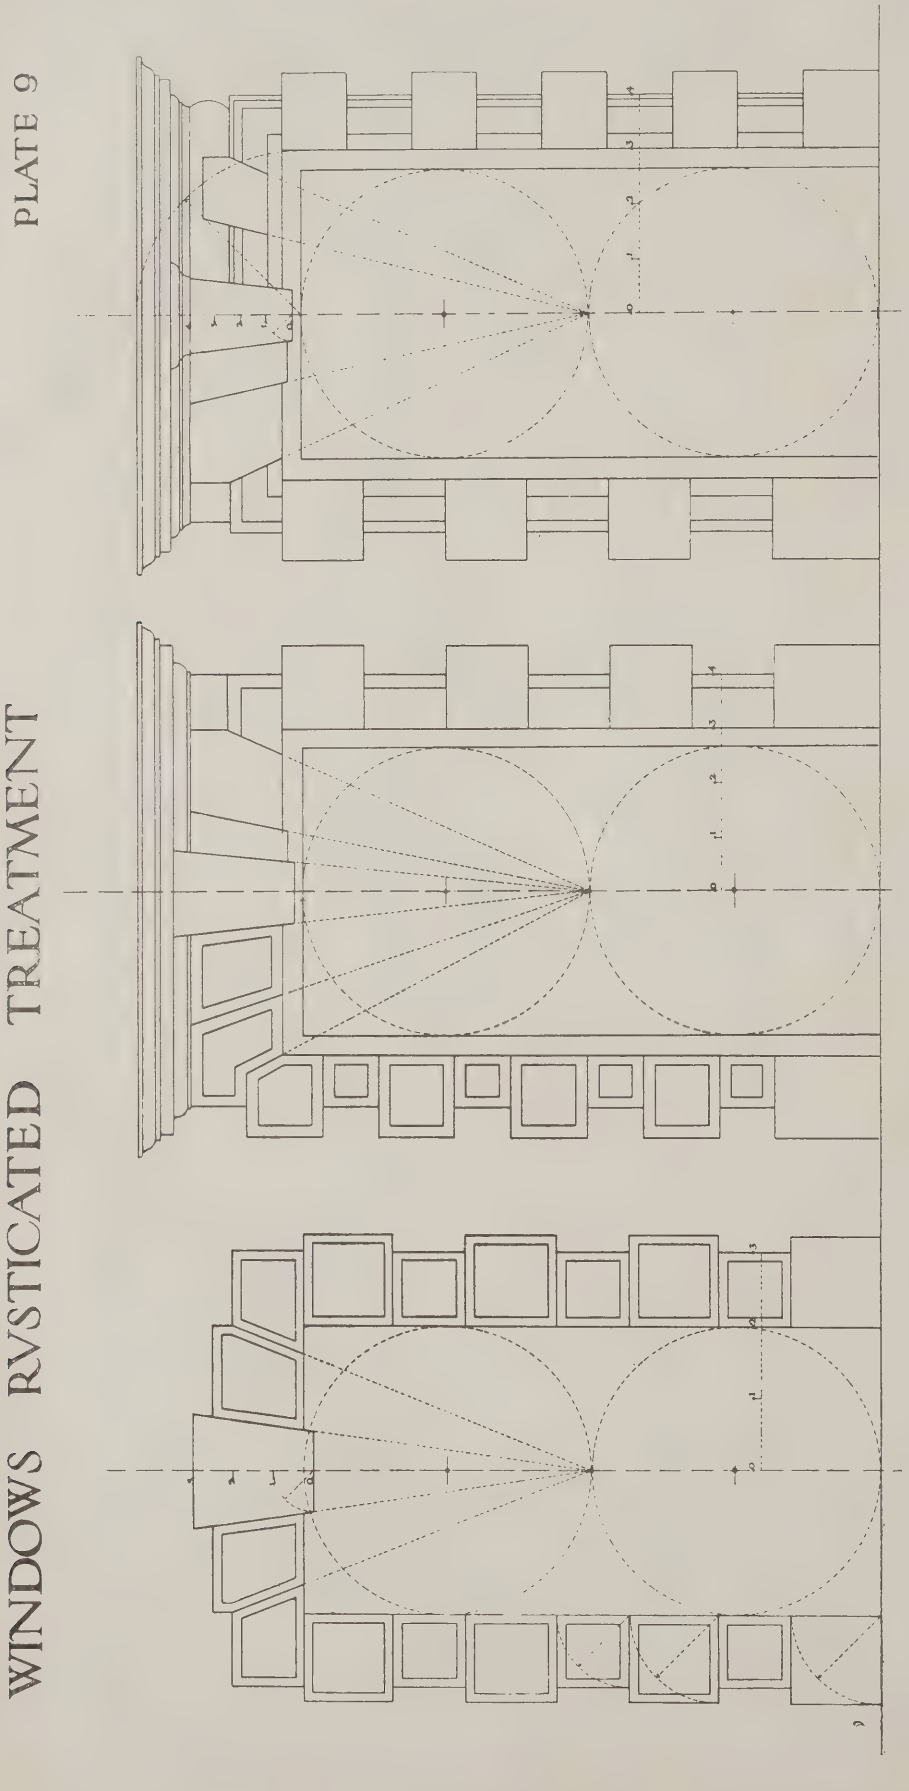


Plate VIII.

Windows and Recesses.

The general remarks made upon doorways apply equally to windows and recesses which may be similarly treated. In the windows shown upon this plate the height of the aperture is twice its width, which gives a good proportion. When an entablature is used its height should be about half, and the architrave one-sixth the width of the aperture. If consoles support the entablature their width should be one-quarter to one-third of their height, and they appear to the best advantage when placed in the positions shown, and in immediate contact with the outer edge of an unbroken architrave. If, owing to circumstances, a window is required of much greater height than twice its width, columns placed on either side will naturally assist in retaining a good proportion and preventing the entablature from appearing too short.

As regards window treatment in general, the centre lines of the openings in successive storeys must, of course, be made to coincide and the same character of dressings maintained throughout any horizontal range of a façade. The distance between the windows should be about 1½ times the width of their apertures, but it may be greater at the angles of the building so as to give strength to the composition. Nothing is so destructive of dignity and repose as excessive variation in the treatment of the fenestration of a building. The study of a few good examples is alone necessary to show the large amount of successful repetition that can be effected in a well-conceived design for one vertical bay of the whole elevation.

Plate IX.

When rustic blocks are used, in place of an architrave, the width of the lower ones should be the same as that of the architrave (about one-sixth the aperture) if an entablature crown the opening. If there be no entablature, as in one of the examples shown upon the drawing, the blocks may be somewhat wider.

The splayed stones at the head of the window have a common centre, as shown upon the plate, and the key block and blocks on either side often project beyond the general face of the dressings. These blocks may further slope forward from the bottom to the top, and can be terminated, with or without mouldings, under the corona of the entablature or above the general line of the horizontal dressings.

Plate X.

This plate shows various window treatments of a simpler character, the ratio of the height to the width of the aperture decreasing until these dimensions are equal, such decrease being generally necessary and often desirable for upper and attic storeys. These windows are often most successful in design when the architrave is broken round them in the manner shown. In this case when an entablature is used the termination of the frieze follows the general line of the architrave.

In the centre of the plate a Venetian window with an arched centre light is shown. The centre opening should be at least twice the width of the side opening, while the breadth of the archivolt should equal the upper diameter of the columns.

Windows of this character are suitable for use as central or occasional features, but they must not occur too frequently in the same façade.

(To be continued.)

INFLUENCE OF MATERIALS ON ARCHITECTURE.

Mr. G. Hartley Goldsmith read a paper on this subject before the students' section of the Manchester Society of Architects last week. Mr. Goldsmith began by pointing out the origin of the Egyptian style from the primitive uses of reed and mud construction. Then, turning to the Greek Doric style, he showed the wooden origin of the entablature and also of the Ionic and Corinthian styles. The Roman style he described as breaking away from trabeated Greek work and developing a new style by means of arch construction combined with the use of concrete. This was carried further in Byzantine times by means of the pendentive dome. The lecturer gave reasons for the origin of the stone vaults which appeared in South France in the Romanesque period, and described how the use of small stones laid in mortar was directly responsible for the development of the Gothic style. Renaissance work he criticised severely, as not being true to the material it used. Modern architecture the lecturer considered to be in a transition stage, architects not realising as yet the full possibilities of steel construction.

Prof. Capper occupied the chair, and afterwards offered some suggestions on points on which the lecturer was rather uncertain.

THE NEW WAR OFFICE.

The Press had an opportunity last week of inspecting the new War Office which has been erected in Whitehall. The building occupies a huge site, and is one of the most important Government buildings completed in London in recent years. The design was originally prepared by the late Mr. William Young in 1899, but it will be recollected that he died before the work was proceeded with very far—before even the foundations were finished. The task of carrying his building to completion was entrusted to Mr. Clyde Young, his son, in conjunction with Sir John Taylor, of H.M. Office of Works.

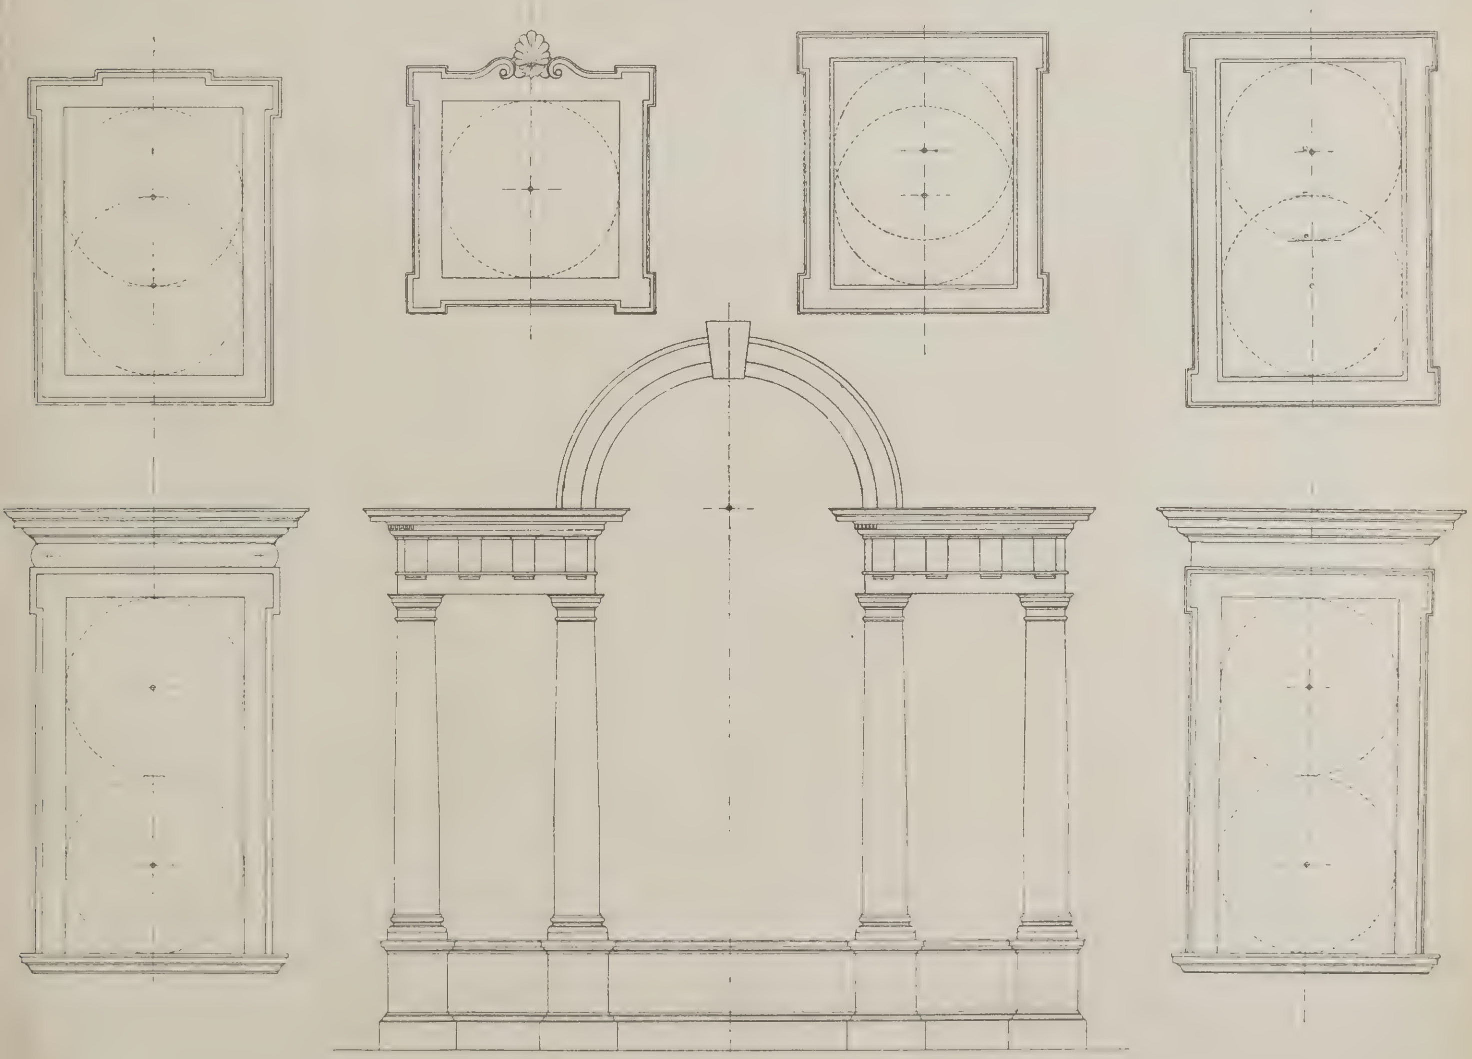
So far as the exterior of the building is concerned, the finest portion in our opinion is the centre portion facing Whitehall, with its colonnade, but we do not care for much of the detail, and it does not strike us that the corner towers are particularly happy in their arrangement. On the curved pediments are sculptured groups by Mr. Alfred Drury, A.R.A., representing Peace, War, Truth and Justice, Fame and Victory.

As regards the interior, undoubtedly the main staircase is the most impressive feature. We publish two views of it as centre plates this week. The general scheme of this staircase, with the main entrance hall, is exceedingly good. The hall is laid with large squares of black and white marble, and on either side are roomy stone fireplaces. The staircase consists of a straight flight leading to a landing, with flights branching right and left to the first floor, where a balustrade and arcading extends around the space. The walls, arches and pilasters are of Painswick stone, with alabaster imposts and balusters, Piastraccia marble steps, and Brescia capping; while at the foot of the stairs are two fine Brescia columns. This staircase has a noble appearance, and the effect is heightened by the manner of lighting with electric lights concealed behind the cornice.

An amazing number of departmental rooms are provided in the building, but they are quite plain and do not call for comment, excepting the rooms on the first floor allotted to the Secretary of State, the Permanent Secretary, the Council of War, &c., which rooms are panelled out in wainscot oak, with enriched plaster ceilings, and fine carved fireplaces embellished with some magnificent marble mantelpieces from the old War Office.

The foundations of the buildings were commenced in 1899 and completed in 1901, being carried down 30ft. below the roadway. The entire site was excavated, and a bed of concrete 6ft. thick laid on the bottom, with side walls of concrete varying from 3ft. to 7ft. in thickness. The erection of the superstructure was

VENETIAN & OTHER WINDOWS PLATE 10.



THE ORDERS AND THEIR APPLICATION. BY ALFRED W. S. CROSS, M.A., F.R.I.B.A., AND ALAN E. MUNBY, M.A.

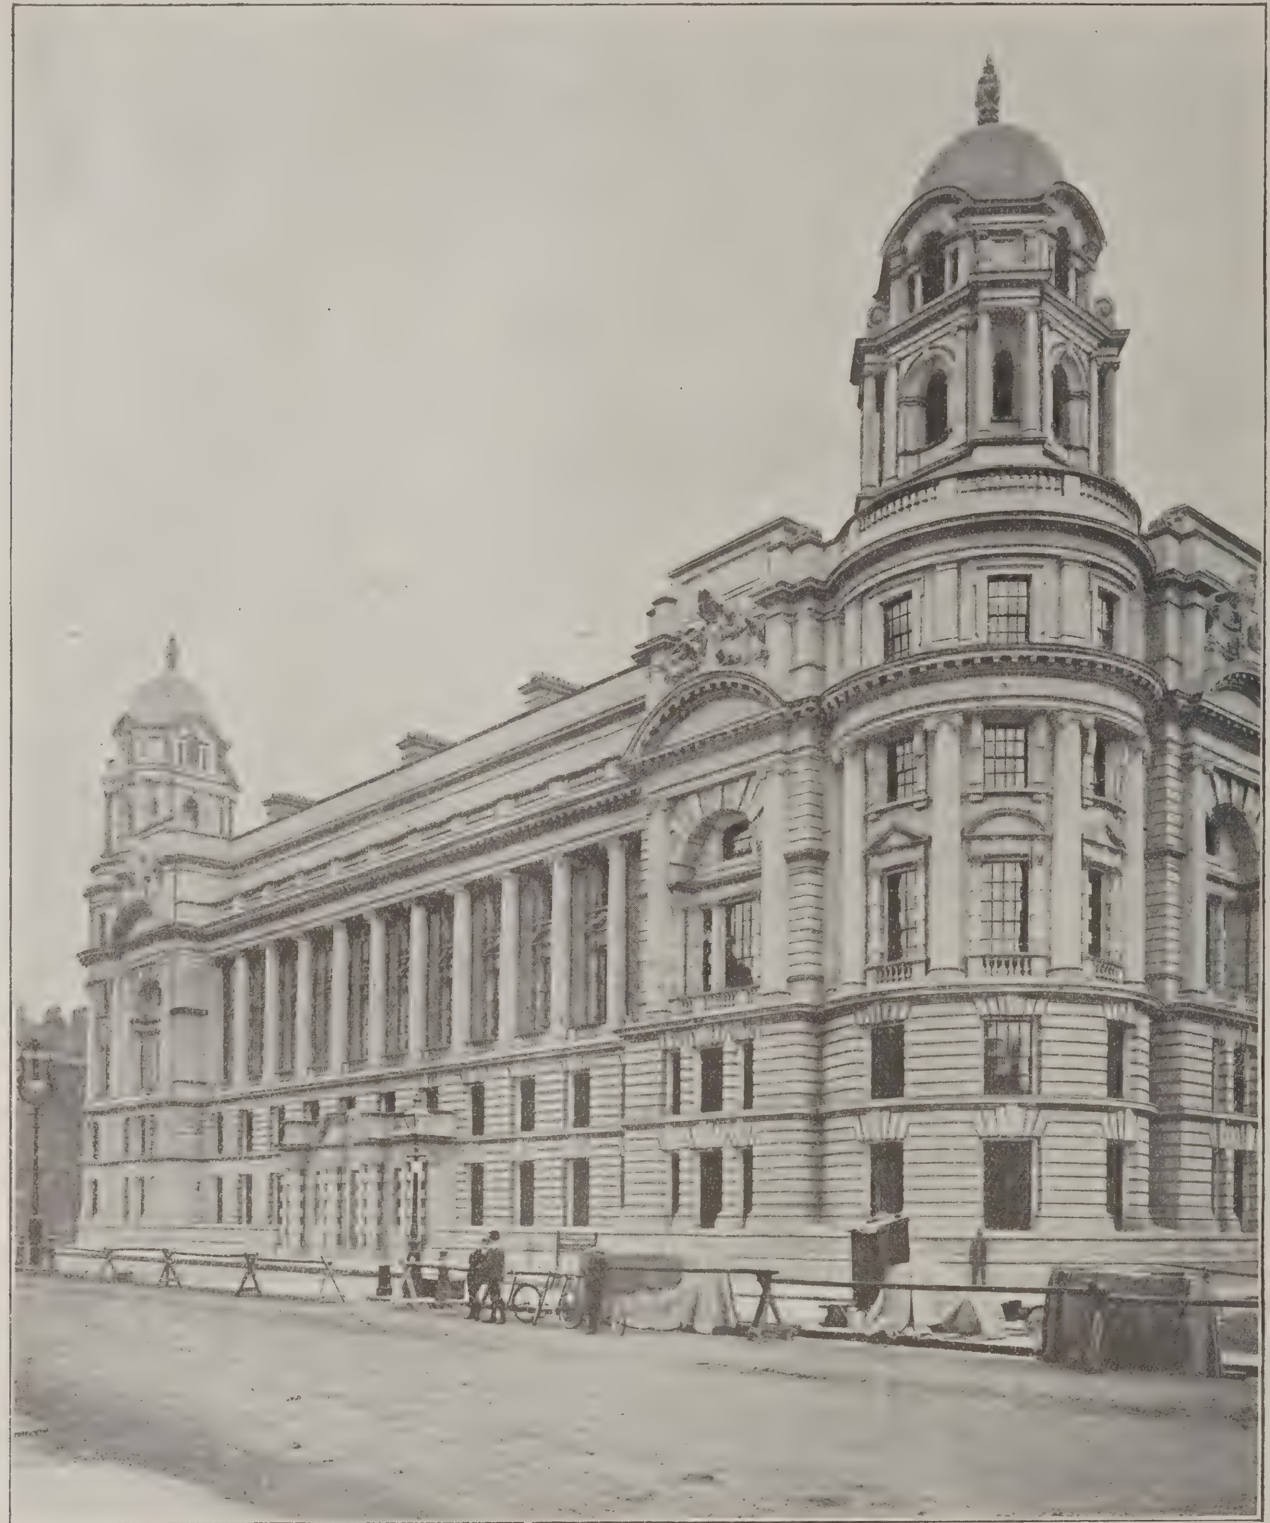


Photo: S. B. Bolas & Co.

THE NEW WAR OFFICE: PRINCIPAL FRONT, TO WHITEHALL. THE LATE WILLIAM YOUNG, F.R.I.B.A., ARCHITECT.

begun in September, 1901, and the building completed this month, well within the contract time, for which achievement great credit is due to the contractors, Messrs. Foster and Dicksee.

The whole of the stone came from the quarries at Portland owned by the Bath Stone Firms, and was specially selected by a Government inspector at Portland before being sent to London, where it was worked in the contractors' yard at Chelsea. For this purpose the most up-to-date machinery was erected, including diamond saws, electric cranes and travellers, the stone being conveyed to Whitehall by motor lorries.

The following particulars of materials used and work done give an idea of the magnitude of the building :—

Bricks (ordinary)	25 millions.
,, (glazed)	$1\frac{1}{2}$ millions.
Portland stone	26,000 tons.
Portland cement	17,000 tons.
York stone	3,000 tons.
Chimney flues	9 miles.
Plaster cornices	17 miles.
Plastering	50 acres.
Steel floor joists	3,500 tons.
Asphalt	7 acres.
Mosaic	18,000 yds.
Glazing	2 acres.

The principal front to Whitehall is 250ft. long, the south front to Horse Guard's Avenue 320ft. long, the east front to Whitehall Avenue 370ft. long, and the north front to Whitehall Place 500ft. long, the height being 80ft.

Within the building are a large quadrangle and a triangular-shaped area faced with glazed white bricks. Below the quadrangle is a hall with massive piers, 25ft. high, to be used as a repository: also the boiler-house, with three large boilers 25ft. long and 7ft. in diameter.

Among the sub-contractors were :—

Plastering.—James Annan, London.
Mosaic paving.—Art Pavements Co., London.
Stoves, chimney-pieces, &c.—Yates, Haywood & Co.
Electric and hydraulic lifts.—Waygood & Co.
Internal wood and stone carving, and marble work, &c.—Farmer & Brindley.
Portland stone.—Bath Stone Firms, Ltd.
Glazed brickwork and "Silex" stone.—Brook & Son, Halifax.
Faïence and wall tiling.—Doulton & Co., Ltd.
Lamp standards.—Coalbrookdale Co.
Floor springs.—Robert Adams, London.
Floor tiling.—J. C. Edwards, Ruabon.
Cement.—Associated Portland Cement Manufacturers, Ltd.

EDINBURGH ARCHITECTURAL ASSOCIATION.

President's Address.

The opening meeting of the Edinburgh Architectural Association was held on Wednesday last, when Mr. Hippolyte J. Blanc, R.S.A., president, delivered the inaugural address. After recalling the fact that the Association was founded about fifty years ago, and that, with the exception of the London Architectural Association, it was believed to be the oldest Association of its kind in the British Isles, Mr. Blanc went on to deal with the growth of Edinburgh and the changes that had been wrought within the past half-century. Turning to the future development of the city, he said it should be made a matter of first importance that the main routes should be direct and wide enough for the increasing traffic. Having regard to the irreparably poor appearance of the Morningside Road approach to the city, also of the Dalry and Gorgie Roads, it might be hoped the Corstorphine, Queensferry and Newington approaches might be kept broad, and guarded against the intrusion of anything affecting their present amenity. When the problem of laying out the new town was under consideration, it was prudently determined to submit the whole scheme for the suggestions of architects. The result justified the resolution, and if Edinburgh had nothing else to show than the very successful and dignified classical compositions in the squares and crescents of the "new town," it had enough to justify its claim to be considered a truly classical city. But of architectural character the later city extensions were mostly devoid.

The Princes Street Proposal.

With regard to the proposal to form a terrace or boulevard on the south side of West Princes Street, Mr. Blanc said that very wisely a model had been constructed to enable citizens to judge the effect of it. The proposal, however, had not taken. There was more involved than could be judged from the model. In the West Gardens the gentle fall from Princes Street Walk and the gradually ascending Castle bank opposite, with the broad valley between, formed a unique picture, which could be appreciated only as a whole, not only by the leisurely, but by the ordinary passer-by. To cut off any of the picture, as seen from Princes Street, would destroy it, and the contraction of the valley, by the intrusion of the continuous stretch of terrace wall, as seen from the lower walk, seemed very undesirable. A few feet in addition to the present Princes Street Walk, and a more dignified railing, would be an improvement, and at much less cost.

Restoration of Holyrood Chapel.

The gift of Lord Leven and Melville for preserving and rendering serviceable the old chapel of Holyrood was one that was certain to appeal to the best sentiments of the citizens. Total decay would, within a very limited period, certainly overtake the building if the inestimable opportunity was not now taken to arrest it. If it could be shown that wasting and disrepair could be rectified, and the building could be made serviceable by retaining all it possessed of original material, and by having the gaps filled in, there seemed no reason why that should not be done.

Architecture and Polite Education.

Mr. Blanc maintained that architecture ought to be made a part of a polite education, but if the public had no opportunity either at school or in after life of being properly directed in the study of it, how could an intelligent appreciation of an architect's labours be looked for? The remedy should be found in the infusion of a love for architecture at school. By so sowing the seeds of elementary knowledge, one could look for a new generation qualified to think and act in sympathy with architectural progress.

The secretary, Mr. Colin B. Cownie, intimated that the Council of the Royal Institute of British Architects had arranged to hold their annual meeting in Edinburgh next summer.

R.I.B.A.

The Temple of Artemis at Ephesus.

At the meeting of the Royal Institute of British Architects held on Monday evening at 9, Conduit Street, W.—Mr. H. T. Hare, vice-president, in the chair—a paper on "The Crœsus (6th century B.C.) Temple of Artemis at Ephesus" was read by Mr. A. E. Henderson, Owen Jones student. Mr. Henderson illustrated his remarks with a number of photographs and drawings, without which it is of little use or interest to give an extended report. We have confined ourselves, therefore, to a very brief summary of the paper.

The remains of the temple were uncovered during the British excavations directed by Mr. D. G. Hogarth in 1904-5. The structure was the fourth that had occupied the site, and remains of another, called the "Hellenistic Temple," had been disclosed. The fragments of architecture that had come to light showed that the columns to the peristyle had circular lower bases about 2 metres in diameter, formed of three orders of double astragals separated by two filleted scotias; many varieties of upper or torus bases were found, the most usual type being parabolic in section with horizontal flutings, 3 gave 40, and 3 gave 48, the complete drums of columns were found, but out of 20 fragments 14 gave 44 flutings, 3 gave 40, and 3 gave 48, the last-named being of an entirely new type, the flutings being alternately wide and narrow. As to capitals, enough portions were found to make an entirely new drawing. Mr. Henderson stated that the batter outwards of the volutes was for the optical purpose of counteracting the excessive foreshortening as seen from the ground, and he mentioned that in Hellenistic times the spiral was contracted horizontally and lengthened perpendicularly for the same optical purpose.

At the conclusion of his lecture Mr. Henderson gave his suggested restoration of the temple, his height making the Order work out at about 8 diameters. He made the entablature ¼ of this, the pediment rose another ⅜ths, and with the surmounting acroteria the proportion of superstructure to colonnades was as 3 to 4. The roof, he suggested, was of tiling and timber, which would account for the total destruction of the temple by the arson of Herostratus.

A vote of thanks to the lecturer, proposed by Mr. D. G. Hogarth, and seconded by Prof. Cecil Smith, concluded the meeting.

Notes and News

The Opening of the new Central Criminal Court next month will be a State ceremony, such as characterised the opening of the Law Courts in 1882.

Aberdeen Architectural Association.—At the last meeting of this Association Prof. Hamilton read a paper on "The Origin and Development of Gothic Architecture."

An Exhibition of American Architecture is open up to the end of this month at the Builders' Exchange, High Street, Birmingham. It has been organised by Mr. W. J. Spurrier, and consists of photographs and drawings of Government buildings, "skyscrapers," and other work in the United States, together with views of architectural work in France and Italy.

L.C.C. School of Building, Brixton.—A course of evening lectures and demonstrations in connection with the stone and wood-carving classes at this school was begun on Monday evening. The course is being given by Prof. Beresford Pite, assisted by Mr. S. R. Cameron and Mr. C. Burgess, and will be continued on December 3rd, January 7th and 21st, and February 4th and 16th.

Leeds and Yorkshire Architectural Society The annual general meeting of this Society was held on November 8th, when the secretary read the annual report of the council. Among other things this stated that the School of Architecture under the auspices of the Society, in conjunction with the Leeds Institute and the Leeds University, was proving of great advantage to the Associates in preparing them in the subjects required for the R.I.B.A. examinations.

A very important plastering contract has just been secured by Messrs. Tanner & Son, of Liverpool and London, in connection with the Victoria and Albert Museum, South Kensington, now being erected from the designs of Sir Aston Webb, R.A. With the exception of the walls, practically the whole of the ceilings, including five or six domes—one of which is several feet larger in diameter than the one at St. Paul's—are to be executed in fibrous plaster. In fact, we are informed that this is one of the largest and most elaborate contracts of plaster work ever let in the United Kingdom.

Leadless Glazes.—The Research Committee of the Christian Social Union (London Branch) is holding this week at the Church House, Westminster, an exhibition of chinaware and earthenware finished with leadless glazes. The aim is to show the high standard of beauty attained in the manufacture of leadless glazed ware, and to recommend this ware to public notice on the ground that it secures the operative engaged in manufacturing it from all danger of lead-poisoning. A belief has latterly become current that lead-poisoning no longer occurs in the Potteries. It is an unfounded belief. Despite the good effect of regulation, and the earnest endeavours of employers to safeguard their workpeople against risk, 106 cases of lead-poisoning among pottery workers are recorded in the latest annual report of the Chief Inspector of Factories and workshops. If this serious "disease of occupation" is to be stamped out completely, there must first be a general demand for leadless glazes.

Disfigurement of Buildings through Match Striking.—So much disfigurement has been caused to the granite entrance to the White Star offices in Liverpool that the directors have had large rough metal slabs fixed on either side of the doorway, with a request carved above them that the slabs shall be used instead of the building.

A new Elementary School at Watford has been erected in Parkgate Road at a cost of about £10,000. It accommodates 720 scholars, on two floors. On each floor is a central hall 50ft. by 27ft., on three sides of which are arranged six classrooms, each 24ft. 8ins. by 24ft. 4ins., for 60 scholars in six rows of dual desks. The architect was Mr. Charles P. Ayres, F.S.I., and the contractors were Messrs. the Oak Building Co., Ltd., of Cambridge.

At St. Luke's Church, Walton, the Hornby Memorial Chapel, on the south side of the chancel, has just been completed and consecrated. It is of red brick and stone, and has seating accommodation for about 50 people. Mr. J. Francis Doyle, of Liverpool, was the architect, and Mr. Samuel Webster, of Bootle, the contractor. The chapel is divided from the church by a handsome pair of wrought iron gates, supplied by Messrs. Thomas Elsley, Ltd.

The Warwickshire Reformatory School for Girls has just been completed and opened. The building is planned for the accommodation of 45 girls and 5 officers, and has cost £5,000 (exclusive of furnishing). Mr. Charles M. C. Armstrong, of Warwick, was the architect, and Mr. Charles Hope, of Berkswell, the builder. Sanitary fittings have been supplied by Mr. W. E. Farrer, of Birmingham. A model hand-laundry at the back will form means of support to the institution.

Messrs. Mellowes & Co., Ltd., of Sheffield and London, have appointed Messrs. Acop, Ltd., of 46a, Market Street, Manchester, as their representatives in that city. Messrs. Mellowes have recently secured the order for glazing, on their patent "Eclipse" system, the roofs of extensions to works of Messrs. Thomas Firth & Sons and Messrs. Cammell Laird & Co. at Sheffield, and the Metropolitan Amalgamated Railway Carriage and Wagon Co., Ltd., at Saltley; also new baths and washhouses at South Shields.

British School at Athens.—At the annual meeting of subscribers, held in London recently, it was stated that next session it was hoped to excavate the site of the Temple of Artemis completely. For this undertaking and for carrying on the work in Laconia £1,500 will be needed. Prof. R. C. Bosanquet described the work of the school during the past year, his remarks being illustrated by a series of lantern views of the work of the students in different fields, and in greater detail the unique finds made at the beginning of the excavations on the site of the Temple of Artemis Orthia at Sparta.

Two Cottage Hospitals.—The new cottage hospital at Moffat was opened recently. The building is one storey high, with attics, and will be used for non-infectious cases only. There are two large wards occupying the south front, with matron's room between; while on the west is a small private ward; in addition to which the usual appurtenant rooms are provided. Mr. Edward C. H. Maidman, of Edinburgh, was the architect. Mr. Maidman was also the architect of the new cottage hospital at Crieff, recently completed at a cost of £1,500. The accommodation here is very much the same as at Moffatt.

SOCIETY OF ARCHITECTS.

President's Address.

The opening meeting of the session of the Society of Architects was held on Thursday evening last at Staple Inn Buildings, when the president, Mr. A. E. Pridmore, delivered his inaugural address. At the outset, while noting with gratification the rapid growth of their membership, he urged that they should be to a much greater degree representative of those whose interests they sought to serve. They should form some comprehensive scheme with this end in view, holding to the principle of the Registration Bill which they were promoting. "My proposal is that, pending statutory registration, we should take steps to enlarge our borders as to become, by force of numbers,

the recognised registering body of the profession.

I hope my remarks may not be misconstrued; my meaning is that, whilst our council should continue to exercise due vigilance and discretion as in the past in admitting members, we ought also to use every legitimate means in our power to extend our membership."

The Society of Architects had outgrown the expectation of its original promoters, and the time had arrived for them to seriously consider the desirability of making an application for a charter; and he expressed the hope that at no distant date it might be placed among the Royal Societies of the United Kingdom.

Proceeding to deal with registration, Mr. Pridmore said the opposition was from within the profession, and confined principally to questions of detail. It was satisfactory to feel, however, that much of the old misunderstanding had been lived down, and there now appeared to be every prospect of further favourable development in the future. Meanwhile, it only remained for them to go on with their Bill.

Speaking of the practice of architecture, Mr. Pridmore observed that the profession was overcrowded to such a degree that many able men found it extremely difficult to make a living, and he strongly advised parents and guardians to think twice before launching their sons and daughters into it.

Continuing, the president made appeal for funds on behalf of the Architects' Benevolent Society, and then went on to emphasise the necessity for the architect to keep himself abreast of the times in regard to the latest details of construction and materials, important legal decisions, and other matters.

Salaried Officials in Private Practice.

Dealing with this matter, Mr. Pridmore said the grievance was aggravated where a local authority placed its architectural work in the hands of an official whose training had not been in any sense architectural. "In such cases the local authorities endeavour to appeal to the ratepayers, as against the architects, on the ground of an apparent saving in the rates in having no outside architect's fees to pay, whereas, as a matter of fact, it is very often the case that the building is found to have cost a great deal more than would have been the case by employing an outside architect. . . . The bitter cry of the architect is heard not only in England, but in Ireland, where, however, steps have been taken in the right direction by the insertion of a clause in the Labourers' Act which prevents the employment of an unqualified person as architect for the purposes of the Act."

Other matters referred to by the president in his address were—the recent decision of the House of Lords in *Kine v. Jolly*, the fire at Selby Abbey, London street improvements, and municipal art control.

BIRMINGHAM MASTER-BUILDERS' ASSOCIATION.

At the annual meeting, held last week (Mr. J. B. Whitehouse, president, in the chair), the committee's report for the year ended October 31st was presented. It stated that, although there had been increased activity in some of the manufacturing trades in Birmingham, the looked-for improvement in the building trade was not yet apparent. Employment throughout the year had continued dull. With regard to the establishment of conciliation boards, a local board had been formed during the year, and was now in working order so far as carpenters, bricklayers and masons were concerned, and it was hoped that during the ensuing year the remaining branches of the trade, not at present parties to the agreement, would come into line. It had been decided by the committee not to give notices for any alterations in the working rules with the operatives this year.

The president, in moving the adoption of the report, said

the outlook for the building trade

was very serious, but he trusted they might have a speedy return to good trade; he was bound to say, however, he could not see any material signs to build optimistic hopes upon. But he pointed out that matters might be improved if the trade unions would only educate their members up to a right and proper feeling in the matter of output, for it was an undoubted fact that during the past twenty years the amount of work done per day had decreased from 30 to 50 per cent.

Speaking of the Trades Disputes Bill, which had now passed third reading in the House of Commons, Mr. Whitehouse said he trusted the powers given would not in any way tend to lessen the good work which had been commenced by the establishment of the conciliation boards. As regards

the Workmen's Compensation Act,

it was clear that this needed much amendment: the present law was so incomplete, so full of defects and so badly drawn that neither masters nor men were secure under its provisions: it had been rightly termed the Lawyers' Compensation Act. What was required was a Bill containing clauses of compulsory and national insurance. Under national insurance it would not matter whether the workman was in the employ of a sub-contractor, chief contractor, or an undertaker; he would be entitled to compensation by law, and would be able to receive it without having deductions in respect of litigation.

The annual dinner of the Association was held in the evening.

Notes on Competitions

Baths at Birmingham.

The Birmingham City Council has decided to invite competitive designs for the new baths to be built in Nechells Park Road, but there will not be any open competition, as the designs are to be invited from certain selected architects.

Elementary School, Slough.

In connection with this competition a "form for architects" is issued by the Bucks Education Committee. By signing this the competitor "begs to offer his services as architect" at an inclusive fee of —— per cent. Comment is needless. But no self-respecting architect will bargain in this unprofessional manner.

An Essay Competition.

The council of the Institution of Heating and Ventilating Engineers has instituted a competition for the best paper dealing with some branch of heating and ventilation work. There is no precise branch stipulated, but the following are suggested as being suitable:—

"Heating plants in private houses,"
"Heating and ventilation of churches or halls with and without mechanical means,"
"The disposition of heating surfaces in various classes of buildings,"
"On the determination of the sizes of flow and return hot-water mains, or steam and condensed mains."

The competition is open to anyone in the British Isles, except the principal of a firm, and the prizes offered are:—1st, ten guineas; 2nd, five guineas; 3rd, two guineas. Further particulars can be obtained from the secretary of the Institution, 99, Fonthill Road, Finsbury Park, N.

List of Competitions Open.

Deposit for conditions given where known.

DATE OF DELIVERY	COMPETITION.
Nov. 30	LIBRARY AT NEWTON-IN-MAKERFIELD.—Cost £4,000. Particulars from C. Cole, clerk to U.D.C., Town Hall, Earlestown, Lancs. No deposit.
Dec. 12	LAY-OUT OF RIDDRIE ESTATE, GLASGOW.—Premiums of £75, £50 and £25. Particulars from A. W. Myles, town clerk, City Chambers, Glasgow. No deposit.
Dec. 31	LABOURERS' COTTAGES AT DUBLIN.—Premiums of £50, £30 and £20. Particulars from A. R. Barlas, secretary, L.G.B. Offices, Dublin.
Dec. 31	DUAL SECONDARY SCHOOL AT GOOLE.—Premiums £50 and £25. Particulars from James W. Johnson, clerk to Governors, Council Offices, Goole. Deposit £2 2s.
Dec. 31	NURSES' HOME AT GENERAL HOSPITAL, WOLVERHAMPTON.—Particulars from J. Stephen Neil, House Governor and Secretary, General Hospital, Wolverhampton. No deposit.
Dec. 31	BATHS AT ASHTON-IN-MAKERFIELD.—Limited to architects in Wigan and Leigh Poor Law Unions. Particulars from A. Sykes, clerk, Council Offices, Ashton-in-Makerfield. No deposit.
1907 Jan. 19	LIBRARY AT PLYMOUTH.—Premiums £50, £30 and £20. MUSEUM AND ART GALLERY AT PLYMOUTH. Premiums £25, £20 and £10. Limited to local architects. Particulars from Borough Librarian, Plymouth.
Feb. 1	CHILDREN'S HOSPITAL AT SUNDERLAND.—Premiums of £100, £50 and £25. Particulars from T. Robinson, secretary, Infirmary Offices, Bank Buildings, Sunderland. Deposit £1 1s.
No date.	ELEMENTARY SCHOOL AT SLOUGH, for 600 children.—Limited to local architects. Particulars from C. G. Watkins, Education Secretary, Education Offices, Aylesbury, to whom applications must be sent by Nov. 30th.

Enquiries Answered.

Tramcar Construction.

MATLOCK.—DIMPLE writes: "Is there any periodical on tramcar construction, both as regards bodies and motors and braking gear?"

"The Electric Tramcar Handbook," published by Alabaster, Gatehouse and Co., 4, Ludgate Hill, E.C., price 2s. 6d. nett, deals with these subjects in a very practical and lucid manner. A paper on "Car Brakes," by Henry Mozley, read at the conference of the Municipal Tramways Association at Leeds on September 20th last, with the discussion thereon, gives much up-to-date information about brakes. H. S.

Kempe's Stained Glass.

EAST YORKSHIRE writes: "In what churches are the best specimens of Kempe's stained glass to be found?—preferably a church where all the windows are by the same artist."

St. Ethelburga, Bishopsgate: East window. *Folkestone Parish Church:* West window (these are, I believe, two of Mr. Kempe's earliest works, and very interesting, 1873-74). *St. Saviour's, Southwark:* Series in nave aisles; north and south transept windows (the southern "Jesse" is particularly fine); eastern triplet in choir; Charles I. and Landseer door at north-east angle of retrochoir; the great east window is among the artist's happiest efforts. *St. Agnes's, Kennington Park:* All, I believe. *St. John the Divine, Vassal Road, S.E.:* Nave. *St. Alban's, Holborn:* MacKonochie Chapel. *St. Paul's Cathedral:* Lower windows of apse; one in west aisle, north transept. *St. Peter's, London Docks:* Eastern rose and lancet on either side. *St. Mary's Cathedral, Edinburgh:* Series. *Solihull Church, Warwickshire:* West end, a "Jesse." *Burford Church, Oxon.:* West window. *Lichfield Cathedral:* Great Late Perpendicular window of south transept; series in chapter-house; the finest is the east window, with figures of St. Thomas of Hereford and Higebriht. *Gloucester Cathedral:* Window in north aisle of choir opposite Edward II.'s tomb; designed by the late Mr. Sedding. *Wakefield Cathedral:* Nave aisles and recently added portions. *York Minster:* East aisle of north transept; two lancets each containing a golden figure on grisaille, copied from some adjacent old glass. *Chichester Cathedral:* Eastern triplet of choir; window at east end of south choir aisle. *St. Mary's, Oxford:* West window. *Leighton Buzzard, Beds:* Clearstory. *Church at Hoar Cross, Staffs.:* One of Mr. Bodley's most sumptuous works. I believe most of the work here is Mr. Kempe's. T. FRANCIS BUMPUS.

Obituary

Mr. James Beaumont, builder, Kirkley, died last week, aged 63.

Mr. William Stark, builder, Westcliff-on-Sea, who died on October 7th, left estate which has been proved at £61,503 gross.

The late Mr. John Wright, builder, of Nottingham, who died on April 27th, 1905, left estate which has been proved at £68,037 gross.

Views and Reviews.

Baths and Washhouses.

It is a curious fact that there are several classes of buildings which have not been treated comprehensively in any book—town halls and baths, for example. With regard to the latter, however, Mr. Cross aims at filling the requirement with the volume now before us. The book is admirably produced (as Mr. Batsford's books always are) and deals with all matters of design and arrangement. Numerous illustrations are given of much interest, but we think the book would have been of still greater use if more buildings had been represented. After an introductory chapter, the author goes on to deal with his subject under different heads—such as swimming baths, slipper baths, hot water and steam services, &c., and in this way he furnishes a mass of information of practical use. Moreover, he has adopted the method in some cases of giving portions of plans to elucidate certain points, which is an excellent method. At the end of the book are given appendices relating to the Baths and Washhouses Act, and London County Council requirements. Being the only up-to-date treatise on a subject which has made considerable strides in recent years, Mr. Cross's book is sure to be welcomed.

"Public Baths and Washhouses" by Alfred W. S. Cross, M.A., F.R.I.B.A. London: B. T, Batsford, price 21/- nett.

Trade and Craft.

Masonry.

Undoubtedly the difficulty of obtaining prompt and satisfactory supply has been of great influence in the restriction of the use of stone for the structure of modern buildings, which even when of an important character frequently reduce stonework to a minimum. Firms able to supply large quantities of any required description of granite, stone, marble and slate satisfactorily as to quality, delivery and price, and willing to meet the chief contractors in every way, are few and far between. Messrs. J. Hodson & Son, Ltd., whose head office is at Nottingham, are one of these firms. Although as a general rule no canvassing is done by them, Messrs. Hodson make a point of being ready to send an experienced representative immediately if requested by telephone or wire to give prices and particulars, and the work will be placed in hand the same day if the contract is urgent. This plan is found advantageous, especially in London, where despatch is everything, and in the case of such occurrences (fortunately infrequent) as the re-erection of the bridge wrecked at Grantham in the recent railway accident, the stonework for which was carried out by Messrs. Hodson in a remarkably short time. Among the works in hand and recently completed by this firm may be mentioned the Central Fire Station, Croydon; new Shire Hall, Nottingham; new schools at Nottingham, Maldon, Bushey, &c.; additions to Cheddleton Asylum; Manor Gardens Library, Islington; additions to St. John's Road Workhouse, Islington; new factories and warehouses at Long Eaton, Draycott, Borrowash, and Derby.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Nov. 22. Barncoose.—*Erection and completion* of proposed houses at Barncoose, for Mr. R. J. Hattam, according to plans and specification, which may be seen by appointment at his residence, Lynwood, Barncoose, Illogan, or at the office of S. Hill, architect, Green Lane, Redruth, from whom all particulars relating to the work may be obtained. Sealed endorsed tenders are to be sent to the proprietor on or before Nov. 22.

Nov. 22. Hull.—*Erection of new buildings* for the Sutton, Southcoates and Drypool Gas Co., at their works, St. Mark Street, Groves, Hull—*i.e.*, Contract No. 1.—Meter testing shop and stores. Contract No. 2.—Chemical laboratory stores, and workmen's lavatories. Persons desirous of tendering can see plans and specifications, and obtain copies of bills of quantities, at the engineer's office, St. Mark Street, Hull. Sealed tenders, addressed to D. Wood, secretary, to be delivered on or before 10 a.m. on Nov. 22.

Nov. 23. Heavitree.—*Erection of a new boundary wall, &c.*, at the site of the New Council School, Ladysmith Road, Heavitree. The plan and specification can be seen, and forms of tender obtained, at the architect's office between 9.30 a.m. and 5.30 p.m. (Saturdays, 9.30 to 1 p.m.). Tenders, written on the above-mentioned form, must reach the architect, 1, Richmond Road, Exeter, not later than the first post on Nov. 23.

Nov. 23. Hingham.—*Reconstruction of the sanitary offices* and other improvements at Hingham school, and for the enlargement and improvement of Wendling school. Builders desirous of tendering should send in their names not later than Nov. 12 to the office of the Norfolk Education Committee, 57, London Street, Norwich, at which office plans and specifications can be inspected, and bills of quantities obtained on and after Nov. 16. Tenders must be delivered by 12 noon on Nov. 23, addressed to "The Secretary, Norfolk Education Committee, 57, London Street, Norwich," and endorsed "Tender for Hingham School, or Wendling School."

Nov. 26. Littlehampton.—*Construction of a screening chamber* and other works, in connection with the drainage of the workhouse at East Preston. Plan and specification can be seen on application to H. M. Potter, architect, Worthing. Sealed tenders to be sent to A. Shelley, clerk, Littlehampton, not later than Nov. 26.

Nov. 26. Accrington.—*Erection of an engine and boiler house* at Altham Bridge. Plans may be seen at the offices of Haywood & Harrison, architects, Accrington, and bills of quantities obtained from them on payment of £2 2s. Tenders, endorsed "Altham Bridge Pumping Station," to be sent to A. H. Aitken, clerk of the Board, Town Hall, Accrington, on or before Nov. 26.

Nov. 28. Glasgow.—*Alterations to the Northern, Western and Southern Police Offices*, for the Corporation of Glasgow. Specifications and forms of tender may be had on application at the Office of Public Works, City Chambers, 64, Cochrane Street. Sealed tenders, marked outside, "Tender for Alterations, Police Offices," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, not later than Nov. 28.

Nov. 28. London, N.—*Erection of an Infirmary* for fifty beds at the Chase Farm Schools, The Ridgeway, Enfield, N., for the Guardians of the Edmonton Union. Drawings and specifications of the proposed work may be seen at the offices of S. Hill, architect, 106, Cannon Street, E.C., and bills of quantities had on payment of £5 5s. (cheque). Sealed tenders to be delivered to F. Shelton, clerk, Lower Tottenham, on or before 9 a.m. Nov. 28.

Nov. 30. Ystrad Mynach.—*Erection of a proposed hotel* at Ystrad Mynach for Messrs. D. Williams & Co., Taff Vale Brewery, Merthyr Tydfil. Plans, specifications, and bills of quantities may be seen at the above address, or at the office of R. Edwards, architect and surveyor, Brynheulog, Treharris. Builders desiring to tender must send in their names to the architect, together with a deposit of £2 2s., when bills of quantities, form of tender, and particulars will be forwarded. Sealed tenders to be sent to W. Griffiths, D. Williams & Co., Taff Vale Brewery, Merthyr Tydfil, endorsed "Tender for Erection of Halfway House Hotel," on or before Nov. 30.

Nov. 30. Ashford.—*Widening of the bridge* over the ditch, Beaver Road, near the Sewage Pumping Station, for the U.D.C., in accordance with the plan and specification, which may be seen on application to W. Terrill, surveyor, North Street, Ashford, Kent. Sealed tenders, endorsed "Bridge Widening," to be sent to J. Creery, solicitor, clerk, 11, Bank Street, not later than 5 p.m. on Nov. 30.

Dec. 1. Bangor.—*Extensive additions and improvements* to the Criterion Hotel, Bangor, Co. Down. Plans and specifications relating to the work may be seen of J. V. Brennan, C.E., architect, Belfast Bank Chambers, Belfast. Sealed and endorsed tenders to be lodged with him on or before Dec. 1.

Dec 3. Wakefield.—*Repairs to Ferrybridge Bridge*, situate on the Doncaster and Tadcaster main road, within the rural district of Pontefract. General conditions, specification, and bill of quantities can be obtained at the office of the West Riding Surveyor, County Hall, Wakefield, on the deposit of £1. Cheques, &c., should be sent to the West Riding Treasurer, at the County Hall, Wakefield. Sealed tenders, duly endorsed, to be delivered at the office of F. G. Carpenter, West Riding surveyor, County Hall, Wakefield, not later than Dec. 3.

Dec. 3. Blackburn.—*Erection of extensions to* Accrington Road Council school, to accommodate 300 children, for the Blackburn B.C. Plans and specifications may be seen and bills of quantities and forms of tender obtained at the office of Cheers & Smith, architects, 24, Richmond Terrace, Blackburn, on payment of £2 2s. Sealed tenders, on forms supplied, endorsed "Accrington Road Extensions," to be sent to A. Gow, director, Education Office, Library Street, Blackburn, on or before Dec. 3.

Dec. 3. Cove, Kincardineshire.—*Construction of new station buildings* at Cove, Kincardineshire, for the directors of the Caledonian Railway Co. The drawings may be seen at the office of the Company's Engineer, Buchanan Street Station, Glasgow, or at the office of the Company's District Engineer, General Station, Perth, where copies of the specification and schedule may be obtained on payment of £2 2s. Sealed tenders, endorsed "Tender for Reconstruction of Cove Station Buildings," to be lodged with J. Blackburn, secretary, Caledonian Railway Company's offices, 302, Buchanan Street, Glasgow, on or before Dec. 3.

Dec. 3. Boston.—*Converting part of the Fish Market* into a lavatory, &c., and converting the old Police Station into a shop. Plans and specifications can be seen at the office of G. E. Clarke, Ass.M.I.C.E., borough surveyor, where forms of tender can be obtained. Tenders to be sent to M. Staniland, town clerk, Municipal Buildings, Boston, on or before Dec. 3, marked "Tender for Lavatories and Shop."

Dec. 3. Strabane and Letterkenny.—*Construction of passenger and goods stations* along this line for the Directors of the Strabane and Letterkenny Ry. Co. The drawings, specifications, and measurers' quantities may be seen at the office of J. Barton, engineer, Exchange Buildings, Dundalk. Tenders must be sent upon the form which will be supplied to intending contractors, and must be with J. Gillespie, secretary of the company, Londonderry, on or before Dec. 3.

Dec. 3. Dublin.—*Erection of a stores building* (two storeys) in brick, 181ft. long by 50ft. wide, with steel principal roof and steel girder supported floor, also offices, 34ft. long, making a total length of block 215ft., at their Dundalk Station, for the Great Northern Railway Co. (Ireland). Parties wishing to tender may see the drawings and specification at the office of W. H. Mills, engineer-in-chief, Amiens Street, Dublin, or copies of them at the office of the District Engineer, Belfast, and can obtain at the said offices lithographed copies of the eight drawings and specification and form of tender on payment of £2 2s. (not returnable) per set. Quantities are not supplied. Tenders for the brickwork, or steelwork, or for the whole of the work, to be made out on the forms supplied by the Company, and endorsed "Tender for Stores Building," should be delivered to T. Morrison, secretary, Secretary's Office, Amiens Street Terminus, Dublin, not later than 10 a.m. on Dec. 3.

Dec. 5. Manchester.—*Erection of the Beaver Road Municipal School*, Didsbury, Manchester. Plans may be seen, and a copy of the bills of quantities (including specification) obtained, at the Education Offices, Deansgate, Manchester, on a deposit of £2 2s. Tenders, on the official forms, and enclosed in the envelopes provided, must be delivered not later than Dec. 5. Cheques to be made payable to the Accountant, Education Offices, Deansgate, Manchester.

Dec. 6. London, N.E.—*Erection of an additional Nurses' Home* at their Infirmary, Whipps Cross Road, Leytonstone, N.E., for the West Ham Union. The drawings and specification prepared by R. Banks-Martin, M.S.A., architect, may be inspected at 121, Plashet Grove, East Ham, E., between the hours of 10 a.m. and 4 p.m. Forms upon which tenders must be made, together with a copy of the bill of quantities, can be obtained of F. E. Hilleary, clerk, Clerk's Office, Union Workhouse, Leytonstone, N.E., on payment of a deposit of £20. Fair wages clause. Tenders, sealed and endorsed, must be delivered to the clerk not later than Dec. 6, at 10 a.m.

ENGINEERING.

Nov. 27. Kingston-by-Sea.—*Supply and fitting* up of a washing machine and Deconden ironing machine for the Guardians of the Steyning Union in their laundry, at the New Workhouse, Kingston-by-Sea, the latter in lieu of the machine at present in use, and for which the Guardians invite an offer for purchase. Particulars and specifications of the work required can be obtained on application to E. Cripps, clerk to the Guardians, Union Offices, New Shoreham, Sussex. Tenders to be sent so that they reach him not later than 9 a.m. on Nov. 27.

Nov. 30. Aberdare.—*Heating apparatus* for the Higher Standard Schools, for the U.D.C. Education Committee. Plans and specifications may be seen at the office of J. Morris, director, Town Hall, Aberdare, or of T. Roderick, architect, Clifton Street, Aberdare. Tenders, with full particulars of scheme, to be sent to Mr. Morris, duly endorsed "Tender for Heating Apparatus," on or before Nov. 30.

Nov. 30. Ashford.—*Widening of the bridge* over the ditch, Beaver Road, near the sewage pumping station, for the U.D.C., in accordance with the plan and specification, which may be seen on application to W. Terrill, surveyor, at his office, North Street, Ashford, Kent. Sealed tenders, endorsed "Bridge Widening," to be sent to J. Creery, solicitor, clerk, 11, Bank Street, not later than 5 p.m. on Nov. 30.

Nov. 30. Sunderland.—*Supply of four* 350 KW. *rotary converters*, static transformers, and high tension switchgear for the same, for the Corporation. The specification and form of tender can be obtained on application to J. F. C. Snell, M.I.C.E., borough electrical engineer, Town Hall, Sunderland, on payment of a deposit of £1 1s. Sealed tenders, addressed to the Chairman of the Electricity and Lighting Committee, Town Hall, Sunderland, must be delivered not later than 12 noon on Nov. 30. Tenders to be endorsed "Rotary Converters."

Dec. 6. London, S.E.—1. *The removal of two externally fired boilers* and one externally fired water-heater, and the supply and erection of two Cornish boilers, steam and feed pipes, pump, hotwell, calorifier, &c., and 2. For the boiler, seatings, flues, building alterations, &c., at the St. George's Workhouse, Mint Street, Borough, S.E., for the Guardians of the Southwark Union, as set forth and described in the specifications and drawings referred to therein, prepared by the Guardians' consulting engineers, the National Boiler and General Insurance Company, Limited, 22, St. Ann's Square, Manchester, from whom copies of the drawings and specifications, with conditions attached, may be obtained on payment of a deposit of £2 2s. Tenders, endorsed "Boilers—St. George's Workhouse," should be addressed to the Guardians, and delivered at Union Offices, John Street West, Blackfriars Road, S.E., by 4 p.m. on Dec. 6., when the tenders will be opened. Fair wages clause.

Dec. 10. Newtownards.—*Construction of a complete system* of waterworks for Newtownards for the U.D.C. The works comprise generally, the driving of about 1,500 yards of tunnel through Scrabo Hill, the construction of a concrete reservoir of 2,000,000 gallons capacity in the Townland of Ballycullen, the laying of an aqueduct and the various distributing pipes throughout the town, consisting of about 16,800 yards of cast-iron pipes, varying in diameter from 10ins. to 3ins., with the supply and fixing of all pipes, valves, meters, hydrants, specials, &c., the construction of a concrete reservoir of 100,000 gallons capacity, in the Townland of Corporation North, and the providing and fixing of pumping engines with all necessary fittings. Plans and specifications may be seen, and a copy of the specification, form of tender and bill of quantities can be obtained upon payment of £1 1s. (which will not be returned) at the office of Swiney & Croasdale, MM.Inst.C.E., engineers, Avenue Chambers, Belfast, on any week day between 10 a.m. and 5 p.m., except on Saturday, when the office closes at 2 p.m. Tenders, endorsed "Tender for Waterworks," to be delivered in sealed envelopes at the office of H. McCartney, clerk to the U.D.C., Town Hall, Newtownards, Co. Down, Ireland, not later than 5 o'clock on Dec. 10.

Dec. 12. Handsworth.—*Supply and delivery* of Contract No. 14.—Permanent way reconstruction and overhead equipment, in connection with the Birchfield Road tramways, for the Handsworth U.D.C. Copies of the specification, with form of tender and condition of contract, &c., can be obtained from Kennedy & Jenkin, consulting engineers, 17, Victoria Street, Westminster, London, S.W., on payment of £3 3s., together with the specification, drawings, conditions of contract, &c. The specification and drawings can be seen at (but not obtained from) the offices of H. Ward, clerk, The Council House, Handsworth, near Birmingham. Tenders on the prescribed form, in sealed envelopes, and endorsed on the outside "Tramways Tender, Contract No. 14," must be delivered to him before noon on Dec. 12. Fair wages clause.

Jan. 3. York.—*Construction of the Selby and Goole Railway*, about 10 miles in length, for the North-Eastern Railway. The works comprise double-line railways chiefly on embankment (upwards of 1,000,000 cubic yards), with stations, station yards, warehouses, cottages, and other buildings, sidings, and bridges. The steelwork of the latter will amount to about 1,100 tons. Plans may be seen, and specification, detailed quantities, and form of tender obtained, on personal application at the office of W. J. Cudworth, Company's engineer, York. Sealed tenders, marked "Tender for Selby and Goole Railway," to be addressed to R. F. Dunnell, secretary, and delivered at his office at York not later than noon on Jan. 3.

IRON AND STEEL.

Nov. 23. Norway.—*Supply of* (1) 463,100 steel plates; (2) 115,100 spring rings for the Norwegian State Railways. Tenders (in sealed envelopes) for (1) should be marked "Anbud paa Underlagsplader"; for (2), "Anbud paa Fjaerringe." Specifications, working drawings, general and special conditions of tender relating to the above contracts may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C. Apart from the usual customs duties, a preference of from 10 to 15 per cent. is given to Norwegian manufacturers. In all cases of Norwegian Government contracts it is obligatory that a resident agent should act for tenderers not residing in Norway, and be responsible to the Government, but it is not necessary for the agent to be a Norwegian firm. Tenders will be received up to 3 p.m. on Nov. 23 at Jernbanestyrelsens, Expeditionskontor, Christiana.

Nov. 24. Durban, Natal.—*Supply and delivery* "free on board" of 4,800ft. of 24ft. diam. cast iron sewerage pipes, from British ironfounders only, for the Corporation. Specifications can be obtained from W. H. Radford, C.E. (consulting and representative engineer to the Corporation), Albion Chambers, Nottingham, on deposit of £2 2s. Sealed and endorsed tenders must be delivered to Webster, Steel & Co., agents to the Durban Corporation, 5, East India Avenue, Leadenhall Street London, E.C., on or before Nov. 24.

Nov. 27. London, S.W.—*Supply of 84ft. spans* for the Secretary of State for India in Council. The conditions of contract may be obtained on application to the Director-General of Stores, India Office, Whitehall, S.W., and tenders are to be delivered at that office by 2 p.m. on Nov. 27, after which time no tender will be received.

Nov. 27. Ilford.—*Supplying and fixing* about 700 lin. feet of wrought-iron ornamental fencing and gates and about 4,670 lin. feet of steel fencing, for the U.D.C. Plans and specification may be seen and form of tender obtained on payment of a deposit of £2 2s., on application to H. Shaw, A.M.I.C.E., engineer and surveyor to the Council, Town Hall, Ilford, during the usual office hours. Sealed tenders, endorsed "Tender for Fencing," must be sent to J. W. Benton, clerk to the Council, Town Hall, Ilford, Essex, on or before noon on Nov. 27.

Nov. 28. Durban, Natal.—*Supply and delivery* "free on board," of No. 30 5-in. by 4-in. galvanised iron pipes, together with bends, offsets, and heads, for the Corporation. Specifications can be obtained from W. H. Radford, C.E. (consulting and representative engineer to the Corporation), Albion Chambers, Nottingham. Sealed and endorsed tenders must be delivered to Webster, Steel & Co., agents to the Durban Corporation, 5, East India Avenue, Leadenhall Street, London, E.C., on or before Nov. 28.

Nov. 28. Dublin.—*Supply of* 800 *tons bullhead steel rails* (85 lbs. per lineal yard), with corresponding fishplates, half to be delivered in February, and half in July, 1907; also for the supply of 600 tons bullhead cast-iron chairs, 300 tons to be delivered in January, and 300 tons in June, 1907, for the Directors of the Dublin, Wicklow and Wexford Ry. Co. Specifications and forms of tender can be had on application to S. J. Shannon, C.E., 1, Westland Row, Dublin. Tenders, marked "Tender for Rails and Chairs," and addressed to M. F. Keogh, secretary, Westland Row Station, Dublin, to be forwarded so as to be received not later than 10 a.m. Nov. 28.

Nov. 29. The Hague.—*Supply of the following railway material:*—Contract No. 434.— Supporting springs. Contract Lit. Z 12.—Mild steed. Contract Lit. A 13.—Corrugated and flat galvanised mild steel, bolts, nails, and hooks. Contract Lit. B 13.—40 uprights for fountains. Contract Lit. C 13.—Zinced wire. Particulars can be obtained from Mr. M. Nijhoff, The Hague, at a cost of 3s. 4d. for Contract No. 434; 1s. 8d. for Contracts Lit. Z 12 and A 13; and 10d. for Contracts Lit. B 13 and C 13. Tenders will be received by Nov. 29 at the Colonial Office at the Hague.

Nov. 30. Malta.—*Supply of a hopper barge.* Tenders are to be accompanied by a deposit of 30s., to be made in the office of the Crown Agents, Whitehall Gardens, London, S.W., by tenderers residing in Great Britain, not having a representative in Malta. Particulars, specifications, &c., may be obtained on application to the Crown Agents for the Colonies, Whitehall Gardens, London, S.W. Tenders will be received at the office of the Receiver-General and Director of Contracts, Valletta, up to 11 a.m. Nov. 30.

PAINTING AND PLUMBING.

Dec. 1. Anerley.—*Redecoration, &c.*, of the school chapel for the Board of Management of the North Surrey District School. The drawings and specification may be seen, and form of tender obtained, at the offices of Hennell & Son, architects, 8 & 9, Essex Street, Strand, W.C. Tenders, sealed and endorsed "Chapel," must be addressed to the Managers, North Surrey District School, Anerley, S.E., and sent in not later than Dec. 1.

ROADS AND CARTAGE.

Nov. 22. London, N.E.—*Kerbing, channelling, paving, making-up, &c.*, of Cotesbach Road (Clapton), for the Hackney B.C. The general conditions of contract and the specification and plan and sections may be inspected, and copies of the bill of quantities and form of tender obtained, on application to N. S. Moonst, C.E., borough engineer and surveyor, and on payment of the sum of £1 1s. Fair wages clause. Tenders, sealed and endorsed "New Street Works," must be delivered at the Town Hall, Hackney, N.E., not later than 5 p.m. on Nov. 22.

Nov. 23. Brighton.—*Supply of 1,000 tons of granite spalls* for the Brighton C.C. The specification and form of tender may be obtained on application at the office of the Borough Surveyor, at the Town Hall, Brighton. Sealed tenders, addressed to H. Talbot, town clerk, Town Hall, Brighton, and endorsed "Tender for Granite Spalls," must be left before 10 a.m. Nov. 23.

Nov. 24. Newhaven —*Supply of 150 cubic yards of granite,* broken to pass through a 1½-in. ring, and to be delivered free either into the Council's carts on the west side of the Harbour, or in trucks at Newhaven Town Station, for the U.D.C. Forms of tender (which alone will be considered) can be obtained from E. Knightley, clerk to the Council. Tenders and samples to be sent to him, under cover, and marked "Granite," not later than Nov. 24, at noon.

Nov. 26. Hemsworth.—*Making of Victoria Street,* Hemsworth, according to plan, section, and specification, which may be seen at the office of T. H. Richardson, in Hemsworth, between 9 a.m. and 5 p.m. Tenders to be sent in to J. Scholefield, clerk, Hemsworth, near Wakefield, on or before Nov. 26.

Nov. 26. Birmingham.—*Supply of road material* (broken or unbroken), delivered at the various railway stations and wharves in the county, for the Warwickshire C.C. Sealed tenders (on forms to be obtained from the County Surveyor), addressed "Tenders for Road Material," must be delivered or sent to J. Wilmot, county surveyor, Birmingham, on or before Nov. 26.

Nov. 27. Bootle.—*Supply of granite paving materials* for the Corporation. Forms of tender may be obtained at the office of B. J. Wolfenden, A.M.I.C.E., Borough engineer, Town Hall. Tenders to be sent to the Town Clerk on or before 10 a.m. on Nov. 27, endorsed "Tender for Granite Paving Materials."

Nov. 27. Batley.—*Levelling, paving, flagging, channelling*, and completing of each of the following streets:—Heaton Road; Yard No. 4, Bradford Road, and Yard No. 7, Bradford Road, in the Borough of Batley, for the Town Council. Plans, sections, and specifications of the said works respectively may be seen on application to O. J. Kirby, borough engineer and surveyor. Sealed tenders, on forms which may be obtained from the Borough Surveyor, properly endorsed, to be delivered to J. H. Craik, town clerk, Town Clerk's office, not later than Nov. 27.

Nov. 27. Woodbridge.—*Road material* for the year ending March 31, 1908, to be delivered as follows for the R.D.C.:—Granite or basalt, broken to 2-in. and 1½-in. gauge, at Council's wharf at Wilford Bridge or Melton G.E.R. Station, 1,600 tons; at Levington Creek and Nacton Hard, or at Orwell and Trimley G.E.R. Stations, 400 tons. Whole chalk flints: at Council's wharf at Wilford's Bridge, 1,600 tons; at Boyton Dock, 200 tons; at Levington Creek and Nacton Hard, 600 tons; at Westerfield G.E.R. Station, 100 tons. All materials to be delivered between April 1 and Sept. 1, 1907, at such times and in such quantities as the Surveyor may direct, and will be subject to his approval. All material rejected by him will remain at the contractor's risk and expense. Tenders, accompanied by samples, must be delivered (carriage paid) to H. E. Kell, New Street, Woodbridge, endorsed "Tender for Road Material," on or before Nov. 27. Any further information may be obtained of George Cook, district surveyor, Grundisburgh, near Woodbridge, by enclosed stamped directed envelope.

Nov. 30. London, N.E.—*Supplying and laying wood paving* in front of the Town Hall and the Hospital, Orford Road, Walthamstow, for the U.D.C. Form of tender may be obtained and plan and specification inspected on application to G. W. Holmes, A.M.I.C.E., Council's engineer, Town Hall Annexe, Walthamstow. Sealed tenders, endorsed "Tender for Wood Paving," to be delivered to C. S. Watson, clerk to the Council, Town Hall, Walthamstow, not later than Nov. 30, at 5 p.m.

Dec. 1. London, W.—*Paving with granite setts* the passageway at the rear of Beethoven Street, and the execution of contingent works, all the granite setts, and certain other materials being supplied from the Council's stock, for the B.C. of Paddington. General conditions, specifications, schedule of quantities, and forms of tender will be furnished upon application to the Borough Surveyor, Town Hall, Paddington, W., upon payment of £1 for a set containing one copy of each document. Tenders, endorsed "Passageway," to be addressed to the Town Clerk and delivered at the Town Hall not later than Dec. 1.

SANITARY.

Nov. 22. London, S.E.—*Reconstructing drains*, providing and erecting new w.c.'s, &c., at the Workhouse, Tanner Street, Bermondsey, S.E. Persons desirous of tendering may obtain specification and printed forms of tender (which can only be received), containing full particulars and conditions, from the Clerk's office, between 10 a.m. and 12 noon daily, until Nov. 16, on depositing a £5 Bank of England note. Sealed tenders, endorsed "Tender for Drains," must be delivered to E. P. Fenton, clerk, 283, Tooley Street, S.E., personally, not later than 6.30 p.m. on Nov. 22, and the tender will be opened and considered at 7 p.m., at the meeting of the Guardians to be held the same day, at which date, time, and place a responsible member of the firm tendering must be in attendance.

Nov. 26. Mears Ashby.—*Constructing sewers* and sewage disposal works in the parish of Mears Ashby for the Wellingborough R.D.C. Plans and specifications may be seen and quantities obtained at the Engineer's office on payment of £2. Tenders, sealed and endorsed "Mears Ashby Sewerage," to be delivered to J. B. Williams, engineer, Moot Hall, Daventry, on or before Nov. 26.

Nov. 28. Enniskerry, Co. Wicklow.—*Construction of sewerage works* at Enniskerry, Co. Wicklow, and other works connected therewith, for the Rathdown (No. 2) R.D.C., in accordance with the plans, specifications, &c., prepared by J. H. Ryan, M.Inst.C.E., and R. M. Butler, A.M.Inst.C.E.I., engineers. Conditions, specification, and quantities can be inspected and forms of tender obtained at the engineer's office, 22, Nassau Street, or at the Clerk's Office, Loughlinstown, on all week-days between 11 a.m. and 3 p.m. Sealed tenders upon the form supplied (and none other will be entertained) to be sent in, and addressed to the Chairman of the Council, not later than 10 a.m. on Nov. 28, and endorsed "Tender for Enniskerry Main Drainage."

Dec. 3. London, S.W.—*Collection and removal of house refuse* in the Eastern District (comprising the Clapham North, Clapham South, Balham, Streatham, and Tooting Wards), for the Wandsworth Borough Council, for the period of one, two, or three years, at the option of the Council from Dec. 31. Forms of tender and specification may be obtained and form of contract seen, of H. G. Hills, town clerk, Council House, Wandsworth, S.W., between the hours of 10 a.m. and 4 p.m. (Saturdays 10 till 1). Fair wages clause. Tenders, sealed and endorsed "House Refuse," must be delivered not later than Dec. 3. No tender will be received unless it is made upon one of the printed forms issued from these offices.

Dec. 5. Watford.—*Supply of about* 1,750 lin. yds. of earthenware or stoneware sewer pipes, 15ins. in diam,, and 1,100 lin. yds. of earthenware or stoneware sewer pipes, 9ins. in diam. Specification and form of tender may be obtained at the Engineer's office, 14, High Street, Watford. Sealed tenders, on the form supplied, addressed to H. M. Turner, clerk, Council offices, 14, High Street, Watford, and endorsed "Tender for Sewer Pipes," are to be delivered, with samples of the pipes, not later than Dec. 5.

Dec. 5. Watford.—*Laying about* 1,750 yards 15ins. diam. earthenware sewer and storm-water drain (mostly in headings), and 960 yards 9ins. diam. earthenware sewer and storm-water drain, together with the necessary manholes, iron pipes, &c., for the U.D.C. Persons desirous of contracting for the work may see the drawings, form of contract, specifications, &c., at the offices of the Council, 14, High Street, Watford, between the hours of 9.30 a.m. and 1 p.m. A copy of the schedule of works and a form of tender can be obtained at the offices of the Council upon the payment of £3 3s. Sealed tenders, addressed to H. M. Turner, clerk to the Council, Council offices, Watford, and endorsed "Tender for Sewerage," must be delivered under cover to him at Watford not later than Dec. 5.

Jan. 7. Stourport.—*Provision, laying and jointing* of cast-iron and stoneware pipe sewers, together with manholes, lampholes and flushing chambers, the construction of task sewer, engine-house, liquefying tanks, distributing carriers, effluent drains, and other incidental works, in accordance with the drawings and specification prepared by the engineers. Drawings and specification may be seen and bills of quantities obtained at the offices of Wilcox & Raikes, engineers, 63, Temple Row, Birmingham, on payment of a deposit of £5 5s. Sealed tenders, in the envelopes supplied, endorsed "Stourport Sewerage—Contract No. 1," to be delivered to C. H. Watson, clerk to the Council, Stourport, not later than 12 o'clock noon on Jan. 7.

MISCELLANEOUS.

The necessary specifications, forms of tender, &c., may be obtained of E. Collins, M.Inst.C.E., city engineer, &c., Guildhall, Norwich. Tenders, on the forms supplied, enclosed in envelopes sealed with sealing wax, endorsed "Tender for ——," and addressed to the Chairman of the General Purposes Committee, must be delivered at the City Engineer's office not later than 10 a.m. on Dec. 3.

TOO LATE FOR CLASSIFICATION.

Nov. 23. Tavistock.—*Erection of new offices, &c.*, at the Council School. The plan and specification can be seen, and forms of tender obtained, at the school between 9.30 a.m. and 5 p.m. till Nov. 22. Tenders, written on the above-mentioned form, must reach the architect, 1, Richmond Road, Exeter, not later than the first post on Nov. 23.

Nov. 23. Manchester.—*Sewering, draining, paving, &c.*, numerous streets, for the Paving, Sewering and Highways Committee. Forms of tender may be obtained on application to the Paving, &c., Department (Surveyor's Office), and must be returned to the chief clerk, Paving, &c., Department, Town Hall, Manchester, before 10 a.m. on Nov. 23.

Nov. 24. Kildorrery.—*Erection of a suitable hall*, which will be considered and decided upon at a meeting to be held on Nov. 25. The structure is to be in accordance with plans and specification, which can be seen at the Kildorrery Post Office. Sealed tenders will be received by the Rev. J. Nagle, C.C., up to and including Nov. 24.

Nov. 26. Harrogate.—*Private street works* required in Back Road at the side of No. 4, Springfield Avenue, for the Corporation. The specification may be seen, and quantities obtained, of F. Bagshaw, borough engineer and surveyor. Tenders must be submitted not later than 9 a.m. on Nov. 26.

Nov. 27. Waterloo-with-Seaforth.—*Sewering, paving, flagging*, kerbing, channelling, &c., in various streets and passages, for the U.D.C. Plans and specifications may be seen, and bills of quantities and form of tender obtained, on application to F. Spencer Yates, A.M.Inst.C.E., the surveyor to the council, at the Town Hall, Waterloo. The sum of 10s. 6d. must be deposited for quantities. Sealed tenders on the forms supplied, addressed to the Chairman of the General Purposes Committee, and endorsed "Tender for Private Street Works," are to be delivered at the Town Hall, Waterloo, not later than 12 noon on Nov. 27.

Nov. 27. Hitchin.—*Erection of a new boiler shaft* at the Union Workhouse, Hitchin. A plan and specification can be seen of A. E. Passingham, clerk, Union Offices, Old Town Hall, Hitchin. Sealed tenders, endorsed "Boiler Shaft," to be received by him not later than 10 a.m. on Nov. 27, and such tenders will be opened at a meeting of the Guardians on the same day.

Nov. 28. Edinburgh.—*Alterations to* 65-73, *Henderson Row*. Plans, specifications, and schedules of measurement prepared by the Burgh Engineer, from whom schedules of quantities and all particulars may be obtained. Sealed offers, endorsed "Tender for Alterations, Henderson Row," must be lodged with T. Hunter, W.S., town clerk, City Chambers, Edinburgh, not later than Nov. 28, at 10 a.m.

Nov. 30. Slough.—*Supply of materials* and labour required in making up, &c., Gray's Road, Slough, for the U.D.C. Plans and specifications may be seen and schedules of quantities obtained from W. W. Cooper, town surveyor, Slough, on payment of a deposit of £1 1s. Sealed tenders, endorsed "Private Street Works," addressed Chairman of Highways Committee, 1, Mackenzie Street, Slough, to be sent in on or before Nov. 30.

Nov. 30. Pontypridd.—Contract No. 1.—376yds. of stoneware pipe sewers and contingent works. Contract No. 2.—Private street works in Graig Terrace. Contract No. 3.—Private street works in Madoc Street. Contract No. 4.—Private street works in Factory Lane. Contract No. 5.—Private street works in Wood Street, Cilfynydd, for the U.D.C. Plans may be seen and specifications and bills of quantities obtained at the office of the engineer and surveyor, P. R. A. Willoughby, A.M.Inst.C.E. Tenders on the prescribed form, sealed and endorsed "Contract No. —" (as the case may be), must be received by J. C. Jones, clerk to the council, Municipal Buildings, Pontypridd, on or before Nov. 30.

Dec. 3. Woodbury.—*Alterations and additions* to The Lodge, near Woodbury, Devon, for Mr. W. Arnold, of Woodbury. Builders willing to tender may see the plans and specifications of E. H. Harbottle & Son, architects, County Chambers, Exeter. Tenders to be delivered to them on or before Dec. 3.

Dec. 5. Leicester.—*Supply of the following materials*, as may be ordered during the year 1907:—(1a) Iron and steel. (1b) Ironmongery, &c. (2) Oils, paints, and sundries. (3) Timber—English. (4) Timber—foreign. (6) Sewerage and other ironwork, &c. (7) Bricks. Form of tender, &c., may be obtained on deposit of 10s. Cheques, &c., should be made payable to the Borough Treasurer. Sealed tenders for each contract, in separate envelopes, addressed to the "Chairman of the Highway and Sewerage Committee," and endorsed "Tender for Stores," are to be delivered to E. G. Mawbey, M.Inst.C.E., borough engineer and surveyor, Borough Surveyor's Office, Town Hall, Leicester, not later than Dec. 5.

Dec. 5. Leicester.—*Supply of granite kerb*, setts, randoms, ringsmall, rammel, spallings, chippings, gravel, &c.; also for Breedon gravel, &c., as may be ordered during the year 1907. Forms of tender, &c., may be obtained on deposit of 10s. Cheques, &c., should be made payable to the borough treasurer. Tenders and samples are to be delivered to E. G. Mawbey, M.Inst.C.E., borough engineer and surveyor, Borough Surveyor's Office, Town Hall, Leicester, not later than Dec. 5, addressed to the "Chairman of the Highway and Sewerage Committee," and endorsed "Tender for Granite."

Dec. 5. Twickenham.—*Erection of new Post Office* at Twickenham. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to J. Rutherford, H.M. Office of Works, &c., Storey's Gate, S.W., where bills of quantities and forms of tender may be obtained on payment of £1 1s. Tenders must be delivered before 12 noon on Dec. 5, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed "Tender for Twickenham New Post Office."

Dec. 11. Cardiff.—*Construction of a bridge* over the railway at Beresford Road level crossing, Cardiff, for the Directors of the Gt. Western Ry. Plans and specification may be seen and forms of tender and bills of quantities obtained at the office of the engineer at Newport Station, between 10 a.m. and 4 p.m. Tenders addressed to G. K. Mills, secretary, Paddington Station, London, and marked outside "Tender for Beresford Road Bridge, Cardiff," will be received on or before Dec. 11.

No date. Wemmergill.—*Additions to and strengthening of* Wemmergill Bridge (stone) at Wemmergill, on the Middleton-in-Teesdale and Brough main road. Contractors desirous of tendering may see the plans and specification and obtain bills of quantities at the County Surveyor's office, County Hall, Northallerton, from Dec. 3—15, inclusive, between 9.30 a.m. and 4 p.m.; Saturdays until 12 noon.

No date. Strensall.—*Laying of about* 370 *lineal yards* of 9in. sanitary pipe, together with the construction of the various manholes, &c., that may be required for the Flaxton R.D.C. Persons willing to tender are requested to forward their names and addresses to E. T. Felgate, Council's surveyor, 3, Stonegate, York. Bills of quantities will be supplied.

New London Buildings

At yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:

COUNTY BOROUGH OF BURNLEY.

EDUCATION DEPARTMENT.

PROPOSED TECHNICAL SCHOOL.

THE EDUCATION COMMITTEE are prepared to receive Tenders for the various works required in the erection of the proposed Technical School in Ormerod Road, Burnley.

Drawings may be seen and Specifications, Bills of Quantities, and Forms of Tender obtained at the Office of the Borough Engineer, Mr. G. H. Pickles, A.M.I.C.E., on payment of One Guinea, which will be returned on receipt of a *bona-fide* tender.

Tenders, endorsed "Tender for Technical School," and addressed to the Chairman of the Education Committee, must be delivered at the Town Clerk's Office, Town Hall, not later than 9 a.m. on Saturday, the 22nd day of December, 1906.

The lowest or any tender will not necessarily be accepted, and persons tendering must do so at their own expense.

E. JONES,
Clerk to the Education Committee.
Town Hall, Burnley,
November 6, 1906.

TENDERS for STORES.

The London General Omnibus Company, Ltd., invite TENDERS for the SUPPLY, during 1907, of the following STORES:—

- (*a*) Timber.
- (*b*) Ironmongery, Coachmakers', Engineers', Saddlers', and Farriers'.
- (*e*) Oil, Glass, Grease, and Sundries.
- (*f*) Coach Trimmings, Canvas, Sacks, and Horsecloths.
- (*g*) Leather and Machine Belting.
- (*h*) Brushes and Brooms.
- (*k*) Building Materials.
- (*l*) Gas and Water Fittings.
- (*m*) Enamelled Iron Plates.
- (*r*) Motor Accessories and Spare Parts.

The Schedules will be ready NOVEMBER 12 and may be obtained at the Company's Coach Factory, North Road. Caledonian Road, N., on payment of 2s. 6d. each, where samples will also be on view, NOVEMBER 14, 15, and 16, between the hours of TEN a.m. and FIVE p.m. Contractors are requested to call and examine the samples before Tendering.

Sealed Tenders, endorsed "Tender for Stores," should be addressed to THE DIRECTORS, 6, Finsbury Square, E.C., not later than NOON, NOVEMBER 26.

By Order of the Board,
R. T. KINGHAM,
Secretary.
6, Finsbury Square, London,
October 24, 1906.

TO CONTRACTORS.

Tenders are invited for the construction of roads and sewers on Heathfield Estate, Gabalfa, Cardiff. Plans and specifications can be seen and quantities obtained at the offices of the undersigned on deposit of £2 2s., which will be returned on receipt of bona-fide tender.

EDGAR DOWN, A.R.I.B.A.,
31, High Street, Cardiff.

Property & Land Sales.

FREEHOLD PROPERTY, VALUABLE, for Sale by Private Treaty; situated in the North of England; comprising six Acres of Land, with Railway Siding from Main Line, and three large Warehouses, together with fully-equipped Cement Works in thorough working condition.—For further particulars apply to J. T. Heppel, 3, Scarbro' Street, West Hartlepool.

WOODFORD.—BUILDING LAND FOR SALE, about 244ft. of frontage to main road. Ripe for the erection of first class shops or can be rented on 99 years' lease. An opportunity to make a good market. Full particulars of F. M. Miles, architect, Woodford Lodge Estate, Fulham Road, S. Woodford.

To Land Companies, Builders, and Speculators.

FINCHLEY, MIDDLESEX (few minutes of electric tram route—a penny fare to Highgate Station).—Valuable FREEHOLD BUILDING LAND, possessing important frontages of over 3,000 ft., including 340 ft. to Long Lane (a parish road), and about 2,900 to proposed roads, comprising the whole of the remainder of the "Brownlow Estate," Squires Lane and Long Lane, suitable for immediate erection of small villas, for which there is an extraordinary demand in this particular part of the parish.—For SALE by AUCTION by

MESSRS. CHARLES SPARROW & SON (in conjunction with Messrs. J. Joslin & Co.), at the Torrington Hotel, North Finchley, on MONDAY, November 26, 1906, at SEVEN o'clock in the evening, in Eight Lots.

Particulars of Messrs. Aird & Hood, Solicitors, 4, Brabant Court, Philpot Lane, E.C.; Messrs. J. Joslin & Co., Estate Agents, East Finchley; and Messrs. Charles Sparrow & Son, F.A.I., Auctioneers and Surveyors, North and Church End, Finchley. Telephone: 30 and 111, Finchley.

If you are at the present time **Seeking a Situation** or if you wish to better your present position,

The "Builders' Journal" Employment Register

offers you exceptional facilities for making your requirements widely known.

Those who have used our columns when advertising for fresh berths have expressed the greatest satisfaction at the results they have obtained, and we append a letter received from one of them:—

"Kindly remove my name from your Employment Register. I am glad to say I have obtained a berth through its agency, for which I am obliged to you."

Every week—we might say every day—we get fresh evidence that employers consult the "Builders' Journal" Employment Register, and appended are a selection from the letters received lately.

A large firm of Builders' Merchants write:

"Referring to the 'Builders' Journal' Employment Register, will you ask No. 1585 to send us particulars of experience, salary required, &c."

A well-known F.R.I.B.A. writes:

"Kindly put me into communication with your advertiser, No. 1637, as soon as possible."

A large firm of provincial Architects write:

"Can you put the following advertisers into communication with us: 1649, 1652, 1654, 1660, 1681 and 1712, and oblige."

The above letters speak for themselves, and it only remains for you to give the Employment Register a trial, and below we give full particulars of the cost of making your requirements known.

For 3s. we give three insertions (four lines) in our "Appts. Wanted" Columns, and also 6 insertions in the "EMPLOYMENT REGISTER" (see page xxviii).

"PYTHO"
PLASTER
UNSURPASSED FOR INTERIOR WORK
Only two coats required.
Commenced and finished in one day.
Can be decorated at once.
As hard as Keene's Cement.
Costs about the same as lime plastering.
For further particulars write to
WOOD BROS.
Draycott in the Clay,
SUDBURY, DERBY.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

IMPROVER to the Writing, Graining, Decorating, &c., wants SITUATION; age 21; just finished apprenticeship.—F. Clarke, 112, Cox Street, Coventry. 2186

PAINTER (good) requires WORK; young man, age 27; town or country; used to all classes of work; abstainer; state wages.—A.W.P., 19, Chesterfield Gardens, Harringay, Middlesex. 21

PLUMBER, good sanitary, lead laying, gas, hot-water, new or jobbing, wants EMPLOYMENT; any distance; age 33; wage 10d.—Plumber, 37, Theydon Street, Markhouse Road, Walthamstow, E. 2196

QUANTITY SURVEYOR'S ASSISTANT (22) desires ENGAGEMENT; 6 years' London experience working up and taking off; temporary or otherwise; London or Provinces; salary moderate.—Box 2165, Builders' Journal.

QUANTITY SURVEYOR'S ASSISTANT (21) desires ENGAGEMENT, temporary or permanent, working up and taking off. Excellent references.—Box W., Builder's Journal Office, 6, Great New Street, Fetter Lane, E.C.

SMITH, GAS & HOT WATER FITTER, Locksmith, Bell Hanger, Stove and Range fitter. Twelve years' experience in builders' work.—J. W., 41, Effra Parade, Water Lane, Brixton. 2193

TO QUANTITY SURVEYORS.—Assistant (30); quick, reliable, good London experience, taking off, measuring-up, expert worker-up, &c. Temporary or permanent; terms moderate.—Box 2169, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

Appointments Vacant.

CLERKS OF WORKS WANTED immediately for Hennebique Ferro-concrete Piling and Jetty Work. Must have had previous experience of this class of work. Probable duration of work, four months. Day and night work. State age, experience, salary required, and all necessary particulars.—Address, Hennebique, 18 Victoria Square, Newcastle on-Tyne.

TRAVELLERS, with connection amongst Architects, Local Government Authorities, and Corporations, are offered excellent side lines in Enamels, Varnishes, Paints, &c. Liberal commission—Box 2156, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

TRAVELLER, calling on Provincial Architects and Builders, to represent Midland firm, on commission; Ornamental Glass. Apply Box 2197, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

Drawings, Tracings &c.

AN ARTIST and DRAUGHTSMAN is prepared to undertake Architectural Drawings or Designs for manufacturing firms, either in office or at home. Perspectives, Illuminated Addresses, &c.—E.S.B., Box 1813, Builders' Journal Office, 6 Great New Street, Fetter Lane, E.C.

ARCHITECTURAL DRAWINGS, TRACINGS, &c., effectively executed by experienced Draughtsmen; very moderate terms.—Stone & Colquhoun, 6, York Buildings, Adelphi, W.C. 2189

ARCHITECT is prepared to undertake designs, working drawings, perspectives, &c.—Box 2204, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

ASSISTANCE rendered in the preparation of Architectural Drawings, &c., at advertiser's own address.—Box 1717, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

DRAWINGS from rough Sketches, Designs, Details, Specifications, Drain Plans and Quantities Prepared; terms moderate.—J. W., 8, Rylett Crescent, Shepherd's Bush, W. 2207

DRAWINGS prepared for Architects, Surveyors, &c.; sketch plans, working drawings, details coloured and finished complete. Specimens produced if desired. Terms 1s. per hour or by agreement.—Mac, 190, Alexandra Road, St. John's Wood, N.W. 2177

PERSPECTIVES AND ELEVATIONS, Pencil, Ink, Monochrome or Colour. Hart & Coxon, 14, Clifford's Inn, Fleet Street, London, E.C. Established 14 years. Specimens sent.

"PRACTICAL STENCIL WORK."—A Guide to Designing and Cutting Stencils and executing stencil work for all purposes. Illustrated by many examples of ornamental stencil designs. Just Published. 3/-. "PRACTICAL GILDING, BRONZING AND LACQUERING," 3/-. Prospectus free. "The Decorator" Office, 365, Birkbeck Bank Chambers, London, W.C.

QUANTITIES AND SPECIFICATIONS ESTIMATES. (Nominal fee if unsuccessful). Experienced General Assistance, Competitions, Designs, Contract, Detail, and Working Drawings—Address, Quantity Surveyors, 21, Liverpool Street, E.C.

THE BUILDERS' JOURNAL
AND ARCHITECTURAL ENGINEER.

November 21, 1906.

FIRE SUPPLEMENT (MONTHLY).

FIRES IN PLACES OF PUBLIC WORSHIP.

The destruction of Selby Abbey by fire is a matter of national regret. With this fire many old associations are swept away, not only for the residents in the neighbourhood, but for many interested in architecture and archæology throughout the Kingdom.

Another fire during the year also calls for remark—namely, the destruction of the St. Michael's Church at Hamburg, a famous landmark in Northern Europe well-known to all who visit the Continent, and more particularly to Americans who travel by way of Bremen or Hamburg. Here again many interesting relics have disappeared with the destruction of the church.

In the case of Selby Abbey we have a fire of what we should term a very ordinary description. It was probably the result of negligence. The edifice being situated as it was the fire was a self-contained one—*i.e.*, it did not affect neighbouring buildings. From a fire service point of view there was little of interest in connection with the burning of the Abbey, for modern means and methods would scarcely be attempted in that district, and if they had been available we are afraid that, as at Hamburg, they would have been futile.

The Hamburg fire, however, is an instance of a highly instructive character, for here we have a high church steeple catching fire, destroying the church, and causing most serious damage in a thickly populated adjoining district, regardless of the fact that it was possible to bring to bear upon it a highly-efficient fire brigade, equipped with considerable steam fire-engine power, and officered by one of the smartest fire chiefs in Europe.

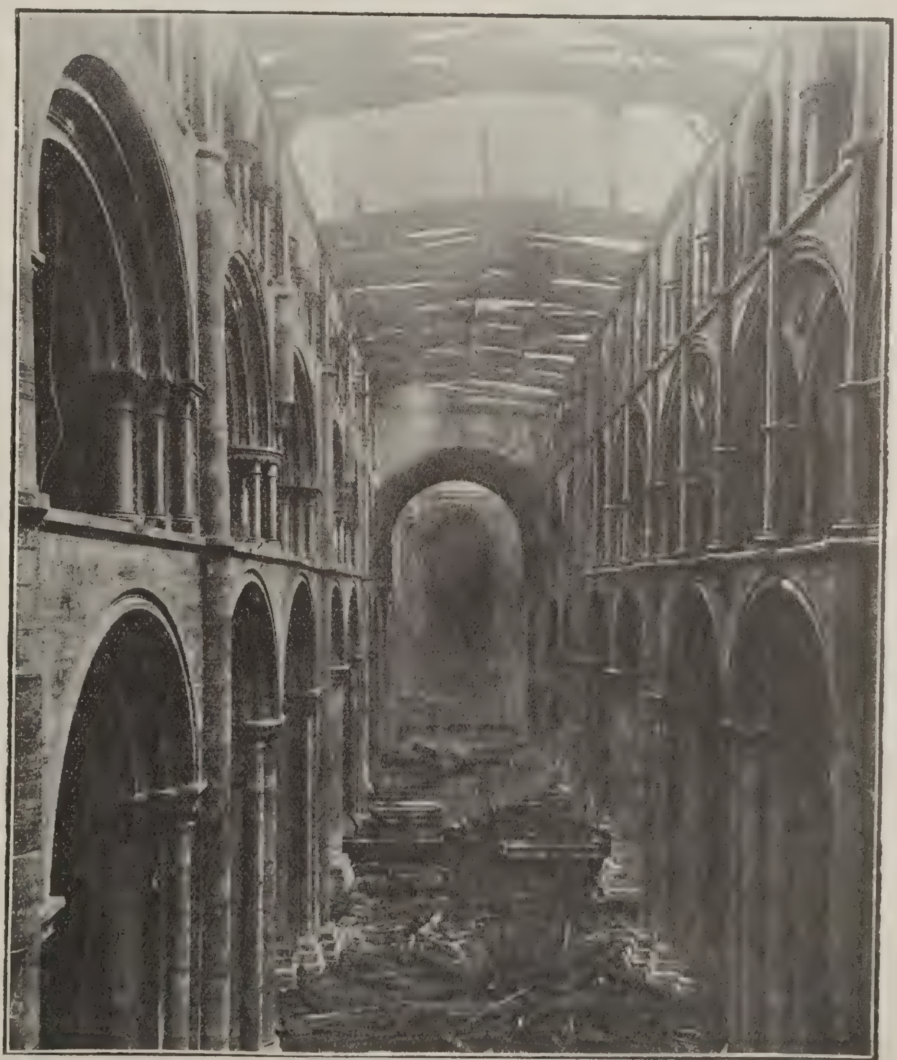
It is obvious to all that there must always be a certain danger from fire and panic in our churches, old and modern alike, during the winter months when the heating appliances are at work, and this has been added to by the increasing popularity of greater artificial illumination than was customary in days gone by. But if a place of worship has been fully recognised by those in authority as a place of hazard to life in case of fire, owing to the possibility of panic, a church has rarely been looked upon as a source of danger to surrounding property. The question of peril to life can be discounted to a great extent by suitable exits with doors properly hung outwards, although we regret to say that by far the majority of our churches are still veritable death-traps in respect to exit facilities. But to look upon a place of worship as a source of danger to surrounding property is certainly something new, and it required the example of the Hamburg fire to make us fully realise that the risk can under some circumstances be very considerable.

As we have indicated above, the Selby fire provides but little that is of value from the technical point of view, and the absence of suitable detailed records precludes our presenting particulars as to the exact progress of the fire.

But in Hamburg—that centre of scientific fire protection—where the annual fire loss has been reduced from year to year in a most extraordinary manner, the necessary data are forthcoming, and we are indebted to the Chief Officer, Herr Westphalen, not only for the valuable photographs which we reproduce, but also for the diagrams and an excellent description which has been issued in the form of his detailed report referred to later.

Selby Abbey Fire.

An enquiry into the circumstances of the fire by which Selby Abbey was partially destroyed on the night of October 19-20, has been held by the Bishop of Beverley, as Archdeacon of York, and Lord Wenlock and Mr. E. C. Brooksbank as assessors. From their report it appears that the fire was first noticed about 12.15, and "there appears to be no doubt whatever that the fire originated in the organ or its immediate proximity." The Lathom Chapel (in the north choir aisle) served as the organ chamber. The organ builder and two assistants had been employed in the organ on the night of the fire. One assistant left at 8 p.m., and the organ builder stated that he and the remaining assistant finished work at 10.30 p.m. They then put out all the gas lights in the Abbey, and removed the wax candles, three in number, which they had been using *in* the organ. Two of these were then extinguished. They spent about 20 minutes more, partly in the blowing chamber, partly in and about the organ, and then, extinguishing the last candle, they left the church and locked the door. On two occasions when the organ builder came into the church from the outside he perceived a slight smell of burning, and his assistant noticed it also. It was in



INTERIOR OF SELBY ABBEY AFTER THE FIRE, LOOKING EAST.

the north aisle of the nave, which is separated from the organ chamber by the whole breadth of the north transept. They endeavoured, without success, to discover the cause of this smell.

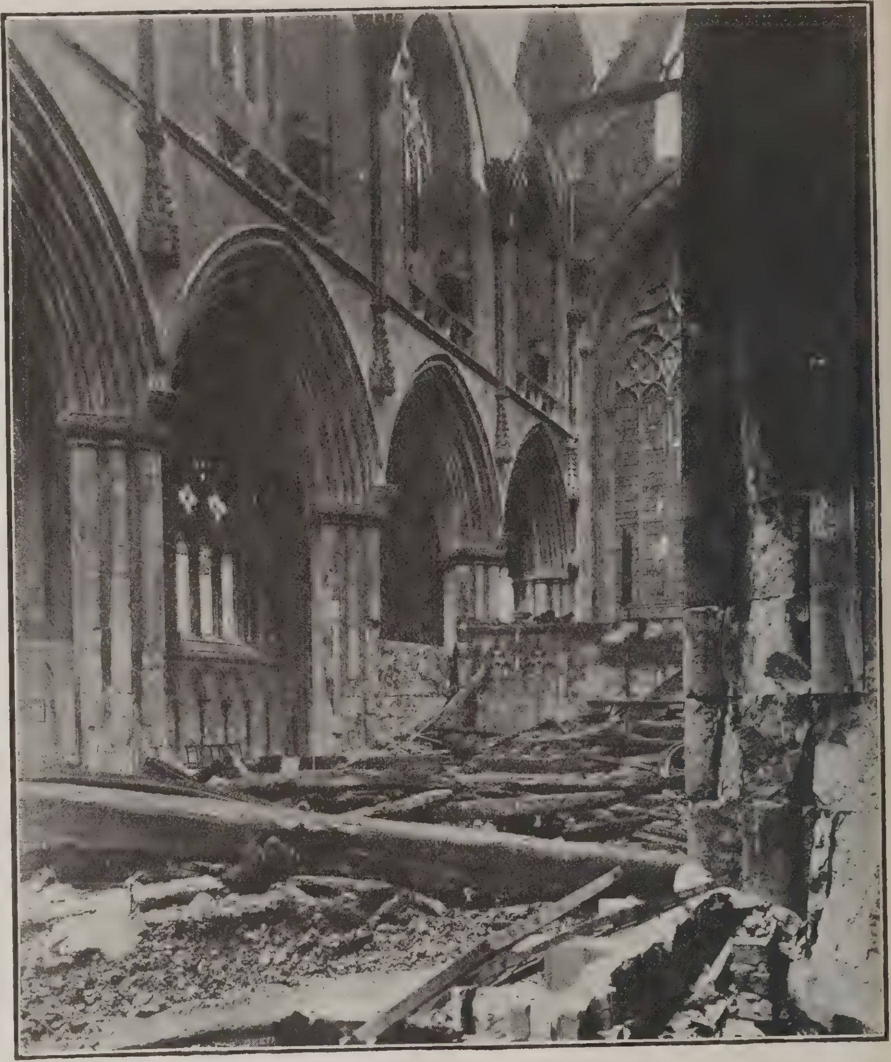
The assessors state in conclusion that they are unable to say in what precise manner this disastrous fire originated. But they feel it their duty to draw attention to certain conclusions which follow necessarily from the evidence. These are:—

"1. They cannot insist too strongly on the need for greater care in the employment of lights within an organ. The evidence in regard to the paraffin lamp and the fact that candles exposed to draughts were used without any protection in an organ largely constructed of perfectly dry wood are both significant. It is said that organ builders always use unprotected candles. But a practice is not the less dangerous because it is customary, and if it is dangerous it is reprehensible. It should be added that much greater caution ought to be used in regard to the possesion of matches by persons engaged in the building or repair of organs.

"2. The circumstances of the fire show how absolutely important it is that means of access to the Abbey should be obtainable close at hand at all times. Much valuable time was lost in getting at the fire because the verger, who had the keys, lived at a considerable distance from the church.

"3. Again, if after the discovery of the lamp in August (it was stated in evidence that this had been left alight in the organ all night) the precaution had been taken of keeping some one in charge of the building during the night as well as during the day until this somewhat dangerous work was completed, the fire would probably not have occurred.

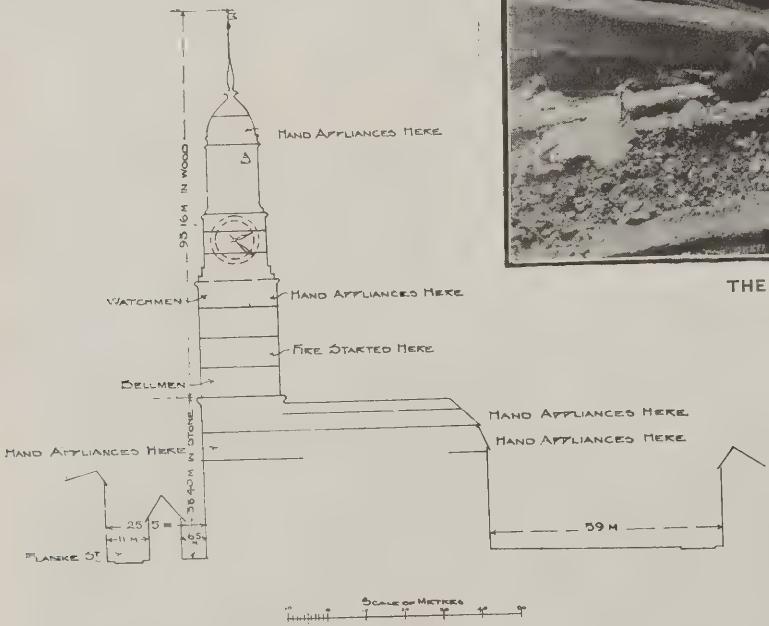
"4. It appears to us to be absolutely essential that when work of any kind is being done in or about the Abbey some responsible official should always inspect the premises thoroughly after the workmen have left the building."



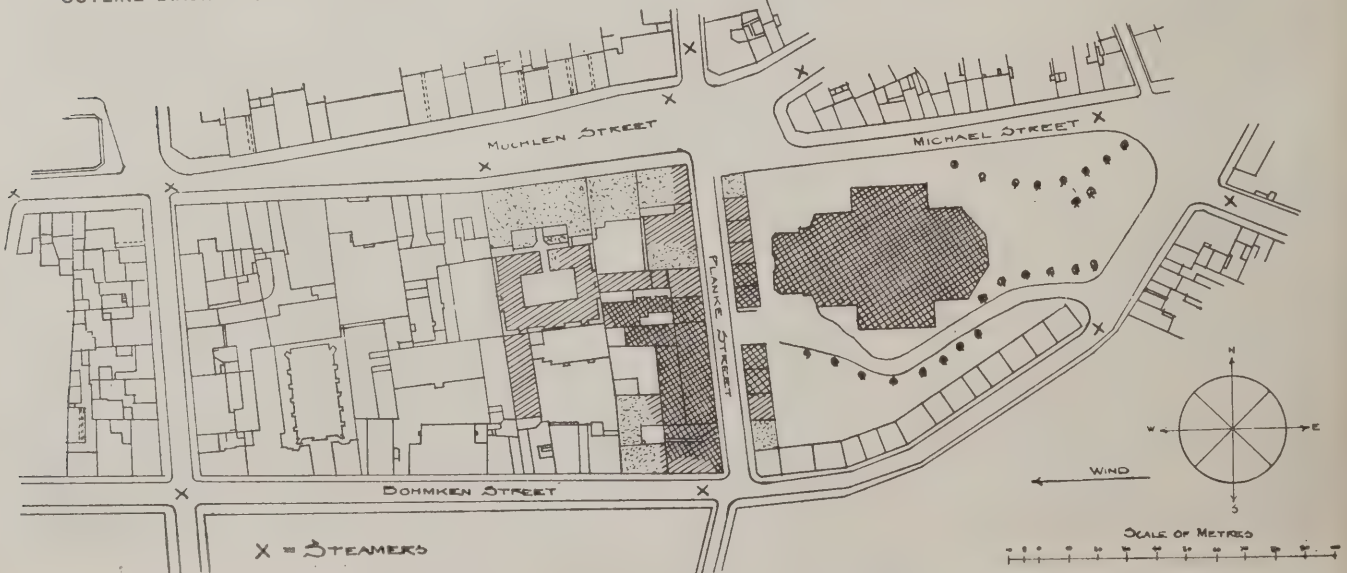
THE CHOIR, SELBY ABBEY, AFTER THE FIRE.

St. Michael's Church Fire at Hamburg.

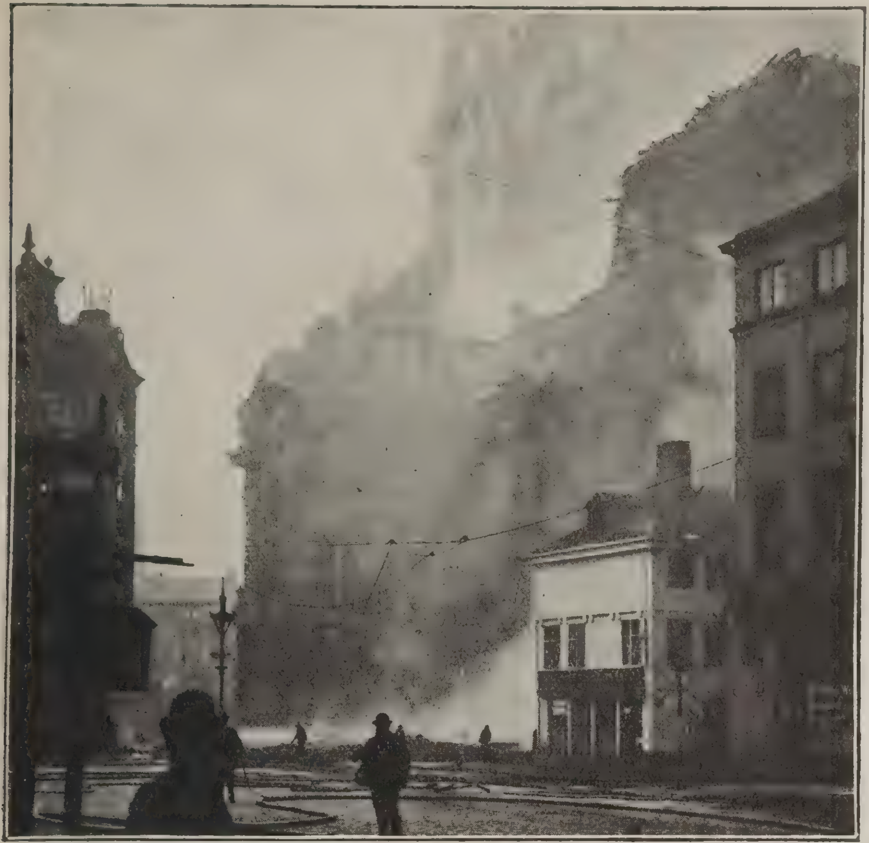
The fire was first made known to the Chief of the Fire Brigade at 2.22 in the afternoon by the arrival of a Morse telegraph message from the top of the spire of the church in question, on which there was permanently stationed a fire watch comprising a day and night watchman, both firemen, and whose duty it was to use the tower as a look-out for the Hamburg area. Translated this



OUTLINE DIAGRAM OF ST. MICHAEL'S CHURCH, HAMBURG.



PLAN OF ST MICHAEL'S CHURCH FIRE AT HAMBURG.



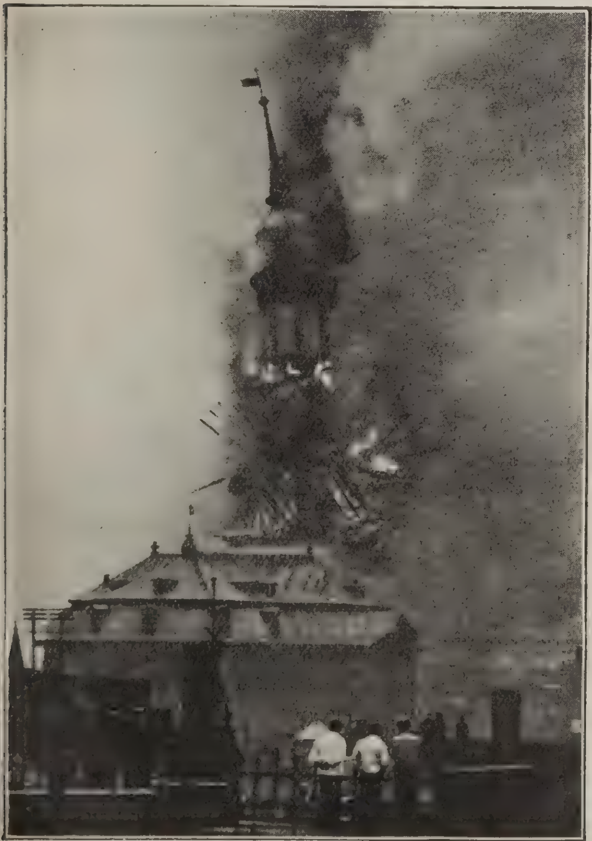
ST. MICHAEL'S CHURCH, HAMBURG, AT THE CONCLUSION OF THE FIRE.

telegram reads as follows:—"Brigade call to tower here." And we would add this was the last message of the day watchman, who died at his post after wiring to the fire brigade headquarters.

A considerable proportion of the brigade on arriving was immediately concentrated on this fire—*i.e.*, eight superior officers, 273 men, 11 steamers (of which five were very large ones), supplemented later on—when there was a possibility of the water supply giving out—by a large float which served as a feeder from a considerable distance.

The work of the fire brigade from the very outset was much hampered by the absence of suitable police arrangements, the majority of the police having been drafted to another district of the city for the reception of Royalty, and for this reason a proportion of the brigade had to be utilised in keeping the crowd back, and also in clearing the tenements on the adjoining property of their inhabitants.

On the arrival of the brigade it was found that the timber tower was well alight at and above the level indicated on the diagram as the bellman's section. An immediate attack was made on the burning building by squads of men under assistant divisional officers. But when the chief came upon the scene the situation was such that these squads had to be withdrawn with all celerity, leaving part of their tackle on the ground. It was obvious to the chief (whose former knowledge as an architect in private practice, and afterwards as a building surveyor, stood him in good stead on such an occasion) that the collapse of the wooden portion of the steeple was imminent, and, what was more, that having regard to the direction of the wind, the steeple would probably so fall as to set alight a considerable portion of the property on the lee side, including a large co-operative stores building. The whole efforts of the brigade were therefore concentrated on preparing for the fall of the steeple, to be in readiness to attack the impending outbreak on the surrounding buildings, and to get to work inside the church the moment the steeple had fallen.

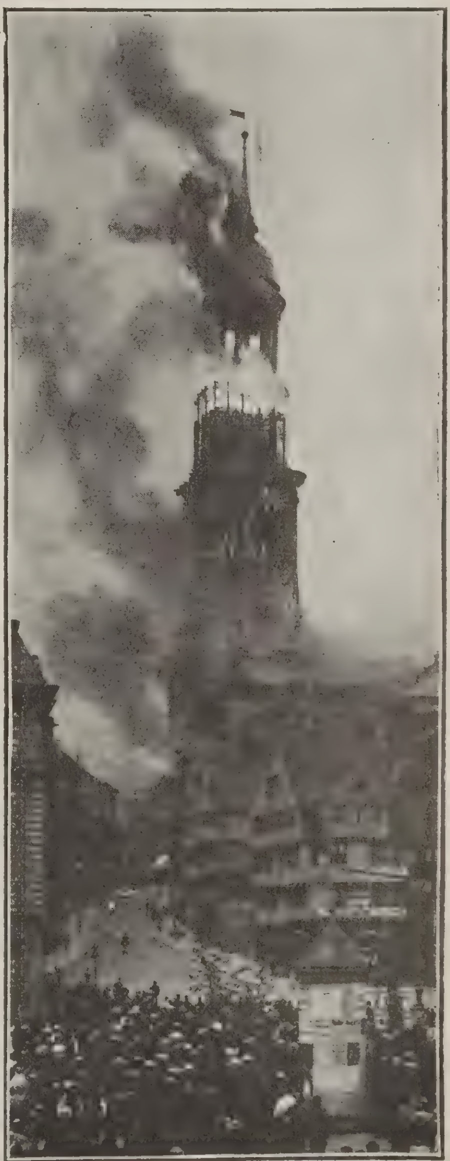


ST. MICHAEL'S CHURCH SPIRE FALLING.

The Spire Collapses.

The collapse of the spire took place at seven minutes past three, some of the main supports on the west side of the steeple already having given way at three p.m. The photograph published on this page gives an excellent representation of the actual fall of the steeple, and is probably one of the finest photographs of its kind.

The final collapse appears to have taken the form of a vertical spreading outward and falling in all directions, whilst the top of the spire fell W. by S.W., toppling over in that direction. The collapse involved a fall of something like 240,000 cu. ft. of timber from heights varying from 120ft. to 350ft. Very few people can, of course, realise what the sudden giving way of that amount of burning timber really means, and to what extent damage must be wrought, not only by fire but impact. Although the roof of the church was badly damaged by the collapse of the eastern side of the spire on



THE CONDITION OF ST. MICHAEL'S CHURCH SPIRE SHORTLY AFTER THE COMMENCEMENT OF THE FIRE.

to its top, a very plucky effort was still made to prevent its destruction, but the brigade was only able to keep the fire on the roof in hand for a sufficiently long time to permit of most of the valuables and relics in the church being saved, in itself, however, a feat of considerable risk.

The Damage to Surrounding Property.

The sketch plan shows the destruction wrought to adjoining property. The buildings cross-hatched were entirely gutted; those hatched from right to left being materially damaged; and those that are stippled being slightly damaged. The points X show the concentration of the steam fire engines, which were situated, as will be seen, almost entirely in positions from which they could be brought to bear upon the lee side. The back of the fire on the adjoining property was not broken until 7.30 p.m., and it continued throughout the night, the majority of the brigade being at work for a consecutive 12 to 13 hours. The amount of water utilised on this outbreak amounted to eighty-seven hundred cu. metres, as much as the average amount of water used by the brigade during any one of the last five years. 35,000ft. of hose were in use.

Interference of the Public.

We made some reference regarding the difficulty of getting the police to keep the ground on such an exceptionally dangerous occasion, and it may be of interest to know that the real concentration only took place after the collapse of the tower, when it had eventually to be supplemented by some 200 infantry in order to protect the neighbouring property from theft.

Besides the fireman on watch duty in the tower, who was killed after he had given the alarm, there was only one other fatality, the stoker in the co-operative stores, referred to above, meeting his death through being caught in a cellar.

As to the outbreak of the fire, it was apparently caused by two plumbers who were occupied on the zinc work about 35ft. below the watchman's room, and were soldering the copper sheathing without removing it from the separating woodwork, some inflammable material having been placed between the sheathing and the woodwork with a view (*sic*) of reducing the possibility of ignition. The inflammable material was a tarred piece of paper. The two plumbers, it would appear, immediately bolted, but a clockmaker, who was attending to the clock in the steeple at the same time, upon the discovery of the fire first assisted the fireman in his attempt to extinguish it with the hand appliances that were available. Upon the fireman and watchmaker finding their efforts futile, the fireman again ascended to the top of the steeple to give the alarm, whilst the watchmaker got out below. It is probable that upon the alarm being given, the fireman again attempted to extinguish the fire until his means of escape were unfortunately cut off.

The National Fire Brigades' Union are contemplating transferring their headquarters from Guildford to London, and an influential sub-committee of that body has been entrusted with the consideration of a suitable programme. There can be no doubt that the transference of the Union's offices to the capital city of the Empire would be most beneficial, both in the interests of fire protection and the fire-service generally.

SAN FRANCISCO EARTHQUAKE AND FIRE.

Since we commented upon this earthquake and the resultant fire on an earlier occasion, many contributions on the subject have been published, for the most part, in the United States. The majority of these have been issued in the interests of specialist firms, such as concrete (plain and reinforced) or terra-cotta specialists, each naturally wishing to indicate the particular excellence of the quality of the materials in which they are interested. Of these numerous publications one, however, stands out from the others from a technical standpoint. It was issued by the Roebling Construction Co., and prepared for that firm by Mr. A. L. Himmelwright, M.Am.Soc.C.E., and a summary of this paper we publish herewith.

We would point out that this report has been written in the interests of a company primarily associated with steel-frame buildings and concrete floors, as distinct from terra-cotta floors and from reinforced concrete construction, but the case has been put in such a way, and the conclusions arrived at form such interesting reading, that we feel this to be an instance where it must rank as an important contribution to the literature of the subject.

In reading the conclusions arrived at, it would probably be well to note immediately that in the United States it is common to differentiate between buildings as Class A and Class B, according to their efficiency for fire resistance, the one being the non-fireproof buildings, and the other the so-called fireproof buildings. We are not able to give the general conclusions quite in full, but we present them very nearly so, only omitting the lessons as regards earthquake shock.

THE LESSONS OF THE DISASTER.

A. L. Himmelwright, M.Am.Soc.C.E.

By adopting the good, discarding the bad, and supplying the omissions, there should be in the future no difficulty in planning and erecting buildings that will be actually fireproof. The best modern practice in the design of the foundations, the exterior walls and the steel skeleton structure is entirely satisfactory. A few details can be improved, but generally these features of the tall building fulfilled the requirements. The problem of making these structures fireproof has, by the recent conflagration, been narrowed down to two principal features or details in their construction: (1) protection of the openings in the exterior walls, and (2) protection of the columns in buildings which are to become receptacles for large quantities of combustible contents.

The glaring omission of the fireproof barriers for the exterior openings was the direct and sole cause of the damage and destruction to the interiors of nearly all the fire-proof buildings. This detail in the present stage of fire-proof construction is of paramount importance and should receive special attention in all future buildings. It is manifestly idle to claim that any building is fire-proof so long as the window and door openings in the outside walls are unprotected by some efficient fire-resisting device.

The insufficiency of the usual practice in regard to column protection was shown in many instances, and is an important development of the recent conflagration.

The definite and exact information on this subject that is now available should be of great value in the economical designing of future buildings.

To summarise and recapitulate, the lessons of the conflagration and the earthquake are given in the order of their importance as follows:—

I. Protect Openings of the Outside Walls against the "External Fire Hazard."

This is the predominant and most important lesson of the fire. As in the case of the Baltimore fire and other recent conflagrations, the flames were communicated to the fire-proof buildings from the outside through the windows and doors. Had suitable devices been provided in the window and door openings, the interiors of these buildings would have been wholly preserved, and the necessary repairs would have been limited to the restoration of the spalling and other damage to the exterors.

There are now available practical devices to safeguard such openings. Metal, or metal covered frames and sashes, wire-glass glazing and inside and outside metal shutters are to be had in great variety of design and finish. Similarly, metal and metal-covered door frames and doors are available to protect the door openings. The National Board of Fire Underwriters can furnish definite and detailed recommendations for specific cases.

An independent water supply, which can be provided by a tank on the premises, with suitable equipment, is also a desirable adjunct to protect the interiors of buildings.

II.—Protect the Columns and other important structural members in proportion to the requirements.

The results of this fire have shown conclusively that the ordinary and accepted methods of protecting columns are insufficient in the case of large stores, lofts, warehouses and similar buildings where large quantities of inflammable material are to be stored. Concrete, well anchored with interior anchors attached to the columns at intervals of 12 ins. to 18 ins. showed the best results as a protecting material.

For office buildings, hotels, institutions and buildings of similar character, a protection 2ins. thick of this material is sufficient. A double layer of wire lath and plaster, with an air space between, or 4-in. hollow tile blocks laid in cement mortar, with the space between the blocks and the column filled solidly with concrete or mortar, will also fulfil the requirements. For stores, warehouses, depots and similar buildings, the thickness of the concrete protection should be increased to 4ins. Common brick, 4 ins. thick, laid in cement mortar with the space between the brick and the column filled solidly with concrete or cement mortar, will also provide suitable protection. For exceptionally severe requirements the thickness of the concrete and the brickwork should be increased, respectively, to 6ins. and 8ins.

In all cases, whether the protection be of concrete, brick, hollow-tile blocks or metal-lath and plaster, it is most essential, in order to ensure good efficiency, that it be securely anchored to the columns at not less than four points in the perimeter and every 12ins. to 16ins. of the length of the column. If such anchors are not provided, unequal heating, the expansion of the column and abnormal stresses and strains are liable to crack the protection and cause it to fall away, no matter how thick or excellent the protecting material may be.

Girders should be similarly and equally protected, concrete being the most efficient and readily adaptable material for this purpose. The beams, while less important members in the steel design, should nevertheless have a protection of approximately one-half of that of the columns and girders in each case.

Suitable protection should be provided for wall girders in cases where the soffits are near the heads of window openings. There were many instances where the wood frames were built directly against the under side of the wall girders, the deflection and bulging of which caused considerable damage to the walls. The neglect in certain cases to protect the steel framing around openings in the fire-proof floors also caused abnormal deflection and bulging to such an extent as to permit the floor spans adjoining the openings to fall out. The failure of large trusses supporting roofs, which frequently wrecked large portions of the interiors of buildings, was also caused by inadequate protection.

III.—Use Refractory Materials for the Facades.

Granite, marble, sandstone, limestone and similar building stones again proved unsatisfactory materials for exterior ornamentation when exposed to fire. All these stones scaled and spalled, and were in many cases so badly damaged as to require entire renewal. These stones are also unsuited for bases, columns, lintels, caps, &c., to support loads in locations above ground where they may be exposed to fire.

Pressed silica brick and terra-cotta brick, made in the size of common brick, withstood the fire in San Francisco better than any other ornamental material. Pressed common brick also proved refractory and gave good results.

Ordinary terra-cotta, with thin shells and webs, while more refractory than the building stones mentioned, failed in numerous instances and gave satisfactory results only in cases where the material was made and erected with care and where the shells or walls were two inches or more in thickness. This material when used should be provided with efficient anchors to hold it in position.

Common brick, when laid in cement mortar, also made an excellent showing and can be depended on to form a complete and efficient barrier against fire. In all cases where facing bricks are used, at least every third or fourth course should be securely bonded to the backing.

IV.—Select a Concrete Floor Construction of Recognised Strength and Fire Resistance.

Concrete floors between steel beams at 5ft. to 7ft. centres developed excellent and satisfactory fire-resistance. They invariably sustained safes and heavy objects during the earthquake and the fire and remained in position even in cases of the most abnormal distortion of the steelwork.

Hollow tile, on account of its brittleness and lesser fire-resistance, is not well adapted for fire-proof floor construction. Wherever this material was exposed to the flames in moderate and normal fires, such as occurred in typical office buildings it was more or less injured, the soffit surfaces falling away and exposing the cellular spaces. On account of its brittleness, safes frequently broke through it and fell from an upper storey, crashing through successive floors to the basement, sometimes inflicting vast damage to the mechanical equipments.

V.—Adopt Reinforced Concrete for Partitions.

None of the usual methods of partition construction fulfilled the requirements. Hollow tile blocks invariably failed in the fire, and by falling into stairway wells and elevator shafts proved to be exceedingly destructive to the stairways and the mechanical equipments in the basements. Reinforced concrete is admirably adapted for a partition construction, and in all the instances where it was used it gave entirely satisfactory results. Metal-lath and plaster partitions, though liable to be distorted, can be depended upon to remain standing and serve as a barrier to prevent draughts and the spread of the flames.

VI.—Never permit Pipes inside the Column Protection.

The bulging of pipes from expansion due to heating damaged and disrupted the column protection in numerous instances before it would have failed otherwise. The location of piping in close proximity to columns is objectionable and exceedingly bad practice. Gases, moisture, &c., from such pipes are very injurious to the columns and facilitate oxidation. A separate enclosure independent of the column protection should, in all cases, be provided for vertical pipes.

VII.—Provide Metal Treads for the Stairways.

Marble and slate treads in stairways should be supported by metal underneath. In many cases where the treads of the stairways were simply outlined framing supporting marble and slate slabs the latter were destroyed or broken by the fire and the stairways rendered unserviceable and dangerous. If metal treads are provided underneath the wearing surface the stairways will remain serviceable during and after a fire, even in case the stone and slate slabs are damaged or destroyed.

VIII.—Provide for the Expansion of Steel Lintels and Mullions.

In numerous cases the expansion of steel lintels bulged the walls over the window heads, requiring extensive repairs. The vertical steel members called mullions frequently deflected and buckled when heated, disrupting the masonry facing and causing it to fall away. When this occurred round interior light courts with a large skylight below, the *débris* from the mullions invariably broke the glass and damaged the frame of the skylight. By providing suitable spaces at the ends of lintels and expansion joints for the mullion members this difficulty would be avoided.

IX.—The Filling between the Fireproof Floor Arches and the underside of the finished floor should never be omitted.

In several instances where this space was not filled, the upper portion of the floor beams being left exposed, the burning of the wood floors and other combustible contents generated sufficient heat to warp and deflect the beams so as to require renewal, straightening or re-rolling. The filling of this space by a light incombustible material, such as cinder concrete, adds to the sound-proof qualities of the floors, and serves as a fire-resisting protection to the upper portions of the floor beams and girders.

X.—Avoid Light Supports and Copper Wire in Metal Lath and Plaster Construction.

Many phases of the flat metal-lath and plaster ceilings were caused by too light or poorly designed clips which supported the furring from the floor beams. Failures also occurred on account of the low fusing point of copper wire which was sometimes employed to attach the metal lath to the furring.

Supporting clips for furring should be made from not less than 1in. by ⅛in. steel stock, and should hook around both sides of the lower flange of the beams.

A mild steel galvanized lacing wire of not less than No. 18 B & S gauge should be used to attach the metal-laths to the furring.

XI. The small Steel Vaults and Portable Fire Safes, even of standard makes, proved most ineffective in preserving their contents.

A vault of suitable design, and built of reinforced concrete or brick, offers better security.

RECENT FIRE TESTS.

Roller Shutters to Windows.

We publish on the next page an article by Captain Sewell on the importance of the protection of window openings, and we observe that the British Fire Prevention Committee has recently issued a report, No. 113, dealing with this question from a somewhat novel aspect. A comparative test has been undertaken and reported upon as between a wire-glass casement protected by a steel rolling shutter and a hardwood casement with wired glazing. This may be considered more in the way of an experimental test than as one intended to prove the efficiency of the roller shutter, with which we have dealt before, and which made such a successful showing. There is no doubt that these roller shutters will keep fire at bay, but there is still the question of radiation to be considered, and in the same way as the directing member in charge of the test with Mississippi wire glazing pointed to the hazards of radiation, so does the directing member of this comparative test call attention to the question of radiation through steel shutters. Efforts will have to be made, and no doubt are being made, not only to make steel roller shutters fire stops, but to make them radiation proof, if we may use this expression, and we have no doubt that, seeing the success in the one direction, success in the other may also shortly be obtained.

Turning back to an early report of the Committee, dated 1899, we find that three examples in which ¼-in. plate glass, 32-oz. sheet glass, and ordinary lead lights were used were put under test for comparative purposes. The 32-oz. glass had fallen and broken after six minutes, and the lead glazing had collapsed after seven minutes, whilst after twelve minutes the ¼-in. plate casement had been burned through.

Now, in this test ordinary 32-oz. glazing was protected by a Kinnear roller shutter placed about 6ins. away, and the result was that instead of the glass letting the fire through in six minutes, the glazing was protected for 47 minutes, at which time the deal sash burst into flame, and the glass dropped out.

The benefit of the shutter even at the closest possible quarters was therefore a gain of 40 minutes. In the test referred to, No. 33 of 1899, the casement was in a teak frame, whereas in this case the casement protected by the shutter was in

OUTSIDE VIEW OF SASHES (PREVIOUS TO TEST).

deal, which makes a considerable difference. We feel that if the roller shutters were treated in some way as regards radiation they would be even more effective at such close quarters as 6ins., and that a development in this particular direction would be most valuable. In the particular case under test the teak sash already showed a glow on the outside in 53 minutes, and in 60 minutes flame had burst through.

Apart from the matter of fire resistance, there is also the æsthetic question to consider: that where a roller shutter is employed the glazing can be ordinary glazing, whilst where wired glazing is utilised the mesh does not add very much to beauty—in fact, quite the reverse.

The test in question cannot perhaps be looked upon quite as a positive test, for it did not go far enough, and a series should be undertaken to arrive at definite results; but nevertheless an instructive lesson is to be learnt from the efforts of the British Fire Prevention Committee in this connection—namely, that although ordinary glazing in suitable frames if protected by Kinnear shutters is excellent under specific conditions, it is yet possible to materially improve its efficiency, on the one hand by doubling the glazing, or applying wire-glass, or on the other by making the shutters less susceptible to radiation.

The advantage of the Kinnear shutter is, however, that even if radiation does ignite anything on the further side, it does not let a body of flame pass through the opening, as in the case of a wire-glazed casement through which fire has passed, and that those trying to confine the spread of fire on its further side thus have much easier work.

OUTSIDE VIEW OF SASHES (AFTER TEST).

Impending Fire Tests.

We understand that the British Fire Prevention Committee will be continuing its series of fire tests with floors during December, and that one of the floors under test will be what is known as an "Armocrete" floor, comprising composite reinforced concrete girders and concrete tubes, in place of the dense terra-cotta tubes that were generally used formerly, and which were found so ineffective as a fire-resistant. It is also anticipated that a further series of reinforced concrete floor tests will be undertaken in the course of the spring.

Forthcoming Reports.

As to reports about to be issued, the next in rotation will be one on the two Houghton doors, and another in respect to the series of tests with the "Kylfyre" powder extinguisher. Extinguishers are not subject to classification, being appliances for which there are no specific standards as yet. Of other publications shortly anticipated, there will be a report of the Committee's Special Commission's visit to Milan, which will embrace both constructional and fire service matters.

THE PROTECTION OF WALL OPENINGS.

By Captain John Stephen Sewell.*

Before the Baltimore conflagration it was not at all uncommon to hear the claim put forth that the contents of the modern so-called fireproof buildings were quite secure from fire originating outside of the buildings themselves, and that, in the event of an interior fire, only the contents of the compartment where the fire originated would suffer. Apparently insurance men considered that a considerable number of fireproof buildings in a given district would make that district conflagration-proof by virtue of the resistance they would offer to the spread of the fire.

Baltimore and San Francisco have demonstrated quite conclusively that, so far as conflagrations are concerned, these opinions were over-sanguine, to say the least. Where interior fires have gutted fireproof buildings, there have, so far, been well-holes or other openings so entirely unprotected that the building was practically not subdivided at all, so that nothing was proved. There have been a number of cases in office and hotel buildings where the contents of a room have burned out and the fire has been confined to the place of origin. In all such cases, however, the amount of combustible matter has been small, and it was quickly consumed, so that the test was not severe. The right kind of fire has not yet occurred in the right kind of building. When it does the interior wall openings will prove as weak against a really severe fire originating within as all openings have proved in the midst of a severe conflagration. Sooner or later some crowded storage warehouse, or some building used partly for offices and partly for sales warerooms, will provide the necessary demonstration.

---

* Captain, Corps of Engineers, United States Army.

It is probable that if architects and architectural engineers had been as well acquainted with fires as they are with æsthetic and structural matters a more nearly fireproof type of building would have been evolved before now. The most striking demonstration of inadequacy in early steel or iron frame buildings was the tangled mass of structural shapes remaining after a fire, and its inevitable collapse. To prevent this a more or less adequate protective covering was applied to the structural metal. Under pressure from the underwriters a few exterior and interior openings were protected with metal or metal-clad doors and shutters. For æsthetic, sanitary and economic reasons, portions of the floors were finished in incombustible materials. Here the change stopped; even underwriters did not urge shutters on principal fronts, and if they had, owners would have laughed at them, for it must be confessed that the tin-clad shutter is a clumsy and hideous object—except when the emergency arises, and it bears the brunt of the battle. No doubt to the owner of the goods behind it—and to the underwriter whose money is staked on their safety—the humble-*looking* device becomes an object of admiration and gratitude, as it demonstrates its reason for being.

Buildings compared to Stoves.

The structural parts of a building are not the only ones that have been made of combustible materials, however. Window and door frames, doors and sashes, base-boards, architraves, floor finishings, timber studs in otherwise incombustible partitions, transom frames, &c.—all these, as well as the contents, were combustible in the older buildings, and the change to incombustible types has hardly affected them even yet. When one builds a stove he leaves an opening through which to light the fire; the analogy in the case of the modern fire-resisting building is plain and has often been pointed out before. But the stove has no openings save those necessary to introduce the fuel and light it, and those required for the admission of air and the disposal of the products of combustion. The draught is so arranged that the fire naturally seeks an outlet only through the openings specially devised to give it harmless exit. Close the draughts, however, and pour a quantity of kerosene on the fire, or build a bigger fire of any highly inflammable materials than the chimney can handle, and the fire will not stay in the stove.

In the case of the fireproof building full of combustible contents the analogy is with the stove in the latter condition, except that the openings for lighting the fire are greatly increased in number and area. The conclusion is that a modern protected steel frame building, with the right kind of occupancy and openings of the ordinary type, may prove to be both a conflagration breeder and a conflagration feeder; it will only rarely be a conflagration breeder, perhaps, but such a rôle is by no means impossible or improbable. It has already been a conflagration feeder, only too often; that it has not demonstrated its capacity in the other direction may be due to good luck rather than to its own inherent excellence. Another reason is that it is not so likely to be subject to specially hazardous occupancy as a building of the older type.

All Wall Openings must be Protected.

It would seem that the time has come to insist upon protection for all wall openings in congested value districts, if not in all closely built districts. In both Baltimore and San Francisco the fire crossed the principal streets as well as the alleys and more subordinate streets. It is claimed that in San Francisco the radiant heat ignited buildings at a distance of over one hundred feet. Mr. S. A. Reed told the writer once of a board fence which he saw ignited, or at least charred, by the radiant heat from a fire even more distant. When the centre of combustion becomes a large area or volume of incandescent gases the law of inverse squares seems no longer to govern the intensity of the radiant heat, and moderate distances are no protection. The conclusion seems inevitable that a wide street is not, in itself, an adequate conflagration barrier. If this is true, either all openings must be protected or conflagrations must be expected, at longer intervals no doubt, but no less regularly than ordinary destructive fires.

The protection of openings, therefore, may be fairly classed as the most important problem now demanding solution in connection with the reduction of the annual fire loss. There is much reason to criticise the type and character of the so-called "fire-proofing" currently used in commercial buildings, no matter what materials may be used, whether terra-cotta, concrete or plaster of Paris. But the poorest of them is sufficient, if the fire does not enter the building—even timber construction would do, if ignition could be prevented. To this one end should be devoted most of the energy now available. When it shall have been accomplished it will be time to improve floor construction, column coverings and other details which have not stood the ordeal as they should.

It is not sufficient, however, to cry aloud that something should be done. Solutions should be suggested, or at least possible lines of development should be pointed out, as often as possible. No doubt ninety-nine out of a hundred will be of no value; but the ninety-nine may be the forerunners of the hundredth, which may prove successful. The writer therefore ventures a few suggestions, with the reservation that he does not claim to have solved the problem, and is not sure that a single one of his suggestions may prove to be the right one, or even of great value.

It is no mean problem, this question of protecting the openings. The current fairly successful methods of admitting light and air and providing communications, while excluding the weather, are the result of careful thought of generations, but even now improvements are possible and much to be desired. To accomplish these ends and also resist the attack of fire without serious sacrifice of appearances, comfort, convenience and adaptability to proper uses is, as before stated, practically an unsolved problem.

An Analysis of Fire Resistance.

It may be useful to analyse the problem into its elements. Resistance to aggression of any sort may be of two kinds—passive and active. Where resistance is entirely passive, it is only a question of time and energy to overcome it. When it is entirely active, it may or may not be successful. Where the two methods are combined, the prospect of success is greatly improved.

A very good example of passive resistance to fire is a solid brick wall; if really solid and thick enough it will resist any ordinary fire, even though the fire be right up against it. Yet if the fire be hot enough and last long enough the wall must ultimately yield and may by elevation of its own temperature ignite combustible objects behind it, even before it yields structurally.

A sprinkler system is a sort of active defence, and any and all methods of fighting fire by human effort are in the same class.

If wall openings could be so finished and protected that they would offer as much passive resistance as the wall itself, the problem would be solved to all intents and purposes. It may be taken for granted, however, that this is impracticable, if not impossible. If such an active defence could be organised at every opening as to extinguish all incipient fires due to radiant heat and prevent the actual entrance of flame, this also would be sufficient, as was very clearly illustrated in the buildings at San Francisco, where such efforts, aided by a certain amount of passive resistance, were successful. The works of the Western Electric Company and the three Federal buildings, which were saved, are the cases referred to. It is probable that the ultimate successful solution will be found to lie in a passive resistance of considerable value, supplemented by active resistance at the points of fiercest attack.

A building with masonry walls and protected openings in a conflagration may be likened to a fortification which is in a state of siege. The character of the structure itself makes entry by the attack a more or less slow and awkward process; yet, as the fort requires a garrison to hold it, so must the building be manned, and all its openings watched, otherwise it must suffer the same fate as the Bush Street Telephone Exchange in San Francisco.

Reduce the number of Wall Openings.

The first step in the creation of a strong, passive resistance is the reduction of openings, in both number and size, to the minimum consistent with their ordinary uses; they should also be as deep as possible. A fort must have entrances, but they do not occupy a whole front, and they are so devised that each shall constitute an easily defended defile. A small window is more easily protected than a large one; and it seems reasonable to suppose that the thick walls of the Federal buildings in San Francisco made the successful defence of unprotected openings much easier than it would have been had the walls been thinner.

The second step is unquestionably the elimination of all combustible material of every description from the trim and finish of every opening; to leave food for the fire at this point is to supply the attack with ammunition from the magazines of the defence.

The next step is to provide real resistance to the attack, at all stages; just as a fort is planned to resist both long-range fire and storming parties, so the protection of the opening must stop both radiant heat and the flame itself. It seems probable that the passive means alone may suffice against the radiant heat; but it is manifest that the close attack must be met by active and well-directed effort on the part of the garrison, supplemented, perhaps, by properly-designed automatic devices. Providing for the active defence is the last and decisive step in the organisation of a victory.

The reduction in the number and size of openings is a question calling for much consideration and good judgment. Light and air are essential; yet it would seem that smaller openings, properly disposed, might be made just as efficient as the vast array of glass so often seen.

Eliminate Wood in Window Finish.

There is no longer any excuse for finishing the openings with combustible materials; metal frames and sashes, metal trim and metal-covered doors are now but little more expensive than those made of wood, and the increased cost in these items could readily be made up by the omission of marble dadoes, columns and pilasters, together with moulded and decorated plasterwork in the interior, where they are often but examples of a too florid taste in design and almost never of real utility.

To prevent the entrance of radiant heat, an opaque screen must be provided. Wire-glass is not sufficient. As radiant heat is the form of first attack, the screen should occupy the outermost line of defence. Just how it shall be provided is a problem demanding solution. In the Bush Street Exchange, San Francisco, some of the openings were closed on the outside with rolling shutters made up of interlocking corrugated slats. Such a shutter will stop radiant heat for a time; if it becomes too severe, there is a danger of the slats warping away from each other, and the actual impact of flame would almost certainly produce this result. The writer is inclined to think that the best solution may prove to be a continuous flat sheet of steel (not necessarily very heavy), or a shutter composed of several such sheets, sliding or telescoping out of sight into a box-head above the window opening proper. The details of design, whereby the sheets may be prevented from warping away from each other and pulling out of the rebates in the jambs of the opening, when subject to high temperatures, are difficult, but probably not impossible. Ease and certainty of operation, facility of repairs, protection from corrosion, &c., are all serious factors of this same problem.

The Use of Triple Sashes.

Behind the outer screen, the sash should unquestionably be glazed with wire-glass. The Colorado building in Washington, D. C., has, in certain of its exposed windows, three sashes, any two of which will close the opening; two are of wire-glass and the third is of clear glass. The result is very satisfactory, so far as light is concerned, and it enables the opening to be closed entirely with wire-glass, when occasion demands. Polished wire-glass would do away with the necessity for the clear glass, but probably at greater cost.

The necessity for the wire-glass arises from the fact that, sooner or later, any outside shutter must yield. At San Francisco the attack was sufficiently prolonged, in many cases, to have accomplished such results. Probably a window sprinkler, properly disposed, either outside of the shutter, or between it and the sash, so designed as to keep the shutter wet, would prolong its useful life. But in a conflagration, the maintenance of the water supply for myriads of sprinklers would be a problem in itself.

If it be assumed that the other opaque shutter must yield, then in important cases, at least, it follows that there should be on the inside another opaque and incombustible screen, to stop the radiant heat after the glass is exposed. This could be very light, for it is not probable that both the outer shutter and the wire-glass would totally yield, unless conditions were much worse than any that have as yet arisen. But it seems that really adequate protection for window openings will ultimately require the triple line of defence, unless some inventive genius shall devise an outer shutter able to resist any attack, which is at the same time inoffensive in appearance and easy in operation.

For exterior door openings, an outer screen or shutter and a metal-covered door of the best type would probably be equivalent to the triple window defence. For interior doors, a single metal-covered door would suffice, in most cases; at strategic points two such doors should be provided for every opening. Interior sashes and transoms would probably be adequate, if made of incombustible materials, and glazed with wire-glass.

So much for passive defence. All these devices, except the sprinklers, are entirely inert, and correspond to the various obstacles contrived, in the defence of fortified places, to impede the attack and delay the enemy at points where the defenders will have him at a disadvantage. The sprinklers are analogous to the mines often planted in the ground over which the attack must advance.

Value of an Active Defence.

The really active defence requires the immediate expenditure of human energy. Every building has a small staff, generally under the orders of the chief engineer. Upon the occurrence of a near-by dangerous fire, this force should securely close all exposed openings. Desks and other combustible articles should be moved from the vicinity of windows and doors. Fire hose should be manned, and pressure put upon the standpipes. Every exposed opening should be watched, and, if necessary, kept wet. If conditions are such that a private water supply can be developed for the building, it should have been included in the original design and construction. It is unnecessary to discuss the necessity for reliable fire pumps and other means of maintaining the water supply; underwriters have pointed out the proper solution of this problem, as well as distributing the water to the points where it may be required. All these things amount to providing the defence with proper weapons and suitable ammunition. Even without them, however, much may be done by a few active and energetic men, if openings are adequately protected—without such protection a whole army of fire-fighters would be flanked out by a conflagration such as those in Baltimore and San Francisco, and compelled to retire. Even in this case, however, the disaster may be lessened if the combustible contents can be removed before the fire takes possession. The building will suffer less damage, and, what is more important, it will probably not pass the fire on to its neighbours.

It is possible, and even probable, that many buildings, with the passive protection above suggested, might take care of themselves in a conflagration, without any active defence; even if gutted themselves, they would almost inevitably act as efficient barriers. But the active defence should in no case be neglected, and the police and fire departments, as well as the military authorities, would better permit a little looting than prevent owners from fighting the fire in their own buildings. Efforts of the kind described herein, if intelligently directed, would do more to stop conflagrations than any possible use of dynamite or other explosives.

The Cost not Prohibitive.

It may be objected that the writer's suggestions as to protection of openings would lead to prohibitive expense; but, if useless ornamentation be sacrificed, this will not be true. It is not claimed, either, that buildings can ever be made absolutely proof against damage. But their contents may be preserved and they themselves maintained in habitable condition—this would make all the difference in the world. After the fire there would inevitably be damage to be repaired on the exposed fronts and most of the protective devices would have to be renewed; but all this is a relatively small matter, if only successful resistance be assured. The rôle of the fire shutter is always that of a forlorn hope; if it results in victory, its own destruction is of minor consequence. Unlike the loss of men in similar circumstances, this one is easily repaired, and no underwriter will begrudge the cost of renewing any protective device which is destroyed in stopping a fire.

It is not only in a conflagration that adequate protection for openings proves a good investment; ordinary severe exposure fires equally demand it. Had it been used in such buildings as the Horne Stores in Pittsburg, and the Home Life building in New York, and others that might be named, much wealth that went up in smoke would have been saved, and the entire country would have been that much better off.

Conditions demand, and building ordinances should require, that every building should neither be an easy prey for the flames itself, nor the means of passing them on to its neighbours. No tentative and half-way methods should be tolerated; the result should be no more in doubt than the ability of the structure to carry, with safety, its ordinary working loads.

A " fireproof " building which permits a conflagration to destroy its contents, and which suffers itself a loss of 60 per cent. and more, is not a success from any point of view, no matter how proudly its structural skeleton may stand above the ashes of its combustible neighbours. The essence of the whole problem is the protection of the openings.

THE BUILDERS' JOURNAL
AND ARCHITECTURAL ENGINEER.

St. Paul's in Danger THE question of the safety of St. Paul's Cathedral has again come into public notice owing to the imminent construction of a new sewer by the London County Council, which it is proposed shall pass close to the south side of the building. The Cathedral authorities did not regard the construction of this sewer as dangerous when it was first proposed by the Council, but new factors have recently arisen which cause the matter to appear in a different light. In constructing the sewer it is not proposed to sink any shafts near the Cathedral, it being intended to drive the sewer in the same way as tube railways are constructed, from shafts sunk on the one side of the Cathedral at Ludgate Circus and on the other at the junction of Queen Street and Cannon Street. The line of the proposed sewer is from 35 to 40ft. away from the nearest point of the Cathedral; it will be 50ft. below the roadway, and about 40ft. below the Cathedral foundations. Therefore, there would be a distance of over 50ft. diagonally between the sewer and the bottom of the foundations. It is stated that the sewer would be 16ft. below the top of the London clay, through which it is to be driven. As our readers are aware, Mr. Somers Clarke recently resigned his post as architect to St. Paul's and Mr. Mervyn E. Macartney has succeeded him. It appears that Mr. Macartney and the clerk of works, Mr. Harding, have been carefully examining the structure, and they have made the alarming discovery that although the south-west tower of the Cathedral has been for some time 13ins. out of the perpendicular, movement has not ceased and the cracks between parts of the structure are widening. It is stated that flooding on the District Railway between Blackfriars and the Mansion House Stations has increased to such an extent that water has to be pumped out almost constantly, and this is considered the immediate cause of the latest settlement. It is believed that there is a gradual subsidence taking place on the whole of the south side of Ludgate Hill and St. Paul's Churchyard. The seriousness of the danger to St. Paul's Cathedral is easily understandable when we remember that the foundations are only 10ft. below the level of the roadway, or about 6ft. below the level of the crypt, and, as borings have shown, rest upon a layer of loamy soil or potter's earth, under which is a stratum of gravel containing from 3ft. to 5ft. of water, which is upheld by, but does not penetrate into, the London clay under the gravel. If the water in the gravel is drained away, naturally the foundations will sink and the only remedy seems to be to underpin the foundations down to an immovable stratum—namely, the London clay, which is 24ft. below the foundations. It has been suggested that the Cathedral might be supported upon a raft of concrete, but if the ground sank at one point this bed of concrete would crack under the heavy load it would be called upon to sustain. The cost of underpinning would be at least £100,000, but it seems the only safeguard for the future. The construction of the sewer has not yet been commenced within two miles of any part of the Cathedral and no shafts have been sunk, so that there is opportunity to modify the plans. The London County Council has come forward with a statement by its engineer, Mr. Maurice Fitzmaurice, which Dean Gregory of St. Paul's thinks is done with the desire of obscuring the issue and precipitating the action with regard to the sewer desired to be constructed. He states that Mr. Macartney thinks the construction of the sewer will be an actual and imminent danger to the Cathedral. In the present circumstances it may, although if the Cathedral foundations were carried down to the clay with the precautions proposed in 1904 by Messrs. Barry, Leslie and Co., the engineers to the Chapter, who were asked to report upon the sewer when first proposed, no danger should result. It is not as if the sewer were as large as a tube railway, for it is only 7ft. 6ins. internal diameter and 9ft. 4ins. external diameter, nor is there any vibration as arises with a railway. Mr. Fitzmaurice has referred, in an interview, to the fact that the Rotherhithe tunnel was cut at a depth of 10ft. below the Thames, yet not a drop of water came through. In the present case there will be 16ft. of solid London clay above the sewer. Mr. Fitzmaurice states that the various suggestions made in 1904 by Messrs. Barry, Leslie and Co. have been all embodied in his specification. These were chiefly as follows:—No void was to be left between the outer skin of the sewer and the London clay displaced to make room for it. The "shield" process was to be adopted and the work carried out under air pressure if necessary, and the excavation in front of the cast-iron rings was not to exceed the minimum amount necessary to insert each cast-iron ring in place. Messrs. Barry, Leslie and Co. further approved the proposal that the cast-iron rings should be 1½in. thick, and they expressed the opinion that with concrete and brickwork inside the tube and cement grouting outside no corrosion need be anticipated. There is already a local sewer in between the proposed sewer and the Cathedral in the gravel 20ft. to 25ft. below the surface, which ought to be done away with. St. Paul's must at no distant date be underpinned and the works should be commenced at once. As soon as the building is shored up, the London County Council's sewer could be allowed to proceed without fear of harm.

NEW BUILDINGS IN GLASGOW.

If we could imagine Glasgow in some sunny clime, with its buildings of clean white stone and the atmosphere free from acid gases and sooty particles, the general impression it would give us would be very striking, because the commercial architecture of "the second city of the Empire" has many claims for attention, though the effect of it is largely diminished by dull skies and a devastating blackening that soon spreads over all buildings. The preservation of stonework in Glasgow has, indeed, become a serious matter.

In our issue for October 3rd, when dealing with new buildings in Liverpool, we pointed out in our prefatory remarks how, by reason of the number of buildings to be considered, we were obliged to confine the meaning of "new" to the last four or five years. The same limit is necessary with Glasgow. In this review, therefore, we have not gone farther back than the Exhibition of 1901. In the years that have since elapsed many important new buildings have been erected, and others equally important are now in course of construction. We think it perhaps best to deal with these in classes rather than chronologically or in divisions of the city.

The insurance companies and the banks of this country, with their huge capital, are very generous in the matter of housing themselves, and in most cities of the Kingdom insurance and bank premises are among the most important commercial buildings. This is the case in Glasgow. Having imposed a limit of five years on our present review, such notable buildings as Mr. J. J. Burnet's savings bank in Ingram Street and Mr. Leiper's "Sun" fire office building in Renfield Street are quite outside consideration, having been completed in the nineties. We find, however, a notable new building of this class in St. Vincent Street, where the

Edinburgh Life Assurance Co.'s Building

has been erected. The architect was Mr. John A. Campbell, of Glasgow. The site lies between two streets, the front being in St. Vincent Street and the back in West George Lane. The front is interesting as a clever piece of modern Italian Renaissance with a good deal of fresh feeling introduced into it, and the rear elevation is also interesting as showing the difficulties which have to be met in lighting suites of offices on narrow streets. The illustration on the next page shows what an enormous amount of window space has been provided at the rear, and also how, by the use of patent casements, the obstruction of light by mullions and transoms has been reduced to a minimum. The building was erected with a steel frame, the columns being encased in brickwork and the girders in concrete. The detailing throughout is very refined, as, for instance, in the cartouches on either side of the main entrance, and in the ironwork to the liftwell. The entrance hall is lined with marble and has a very rich effect, and throughout the building the work is well executed. A restaurant is provided for on the ground and basement floors, the ventilation and warming being on the

EDINBURGH LIFE ASSURANCE BUILDING, ST. VINCENT STREET.
JOHN A. CAMPBELL, I.A., F.R.I.B.A., ARCHITECT.

"Key" plenum system. The air, after being filtered, washed and humidified, is warmed in winter and cooled in summer, and delivered in such volume as to renew the air 15 times per hour—a complete change every four minutes.

The contractors were as follows (of Glasgow, except where otherwise stated) :—

Mason work, Morrison & Mason, Ltd.; *joinery*, Mathew Henderson; *steelwork*, Redpath, Brown & Co., Ltd., Edinburgh; *plumbing*, James Goodlet, *plastering*, George Rome & Co.; *glazing*, C. & S. Malloch; *painting*, George W. Sellars; *tile and marble work*, Galbraith & Winton; *fireproof floors*, S. Ferguson & Co., Carlisle; *electric lighting*, J. B. Meiklejohn; *electric passenger lifts*, Otis Elevator Co., London; *heating and ventilation*, William Key; *grates*, W. McGeoch & Co., Ltd.; *wrought-iron gates at entrance*, Hardman, Powell & Co., Ltd., Birmingham; *lift enclosure*, Donald Clerk & Son; *stone carving*, H. H. Martyn & Co., Cheltenham; *name plates*, Bromsgrove Guild of Handicraft, Bromsgrove; *steel casements*, Henry Hope & Son, Birmingham; *enamelled and fireclay bricks*, Shawrigg Fireclay Co.; *terra-cotta bricks*, New Cleghorn Terra-Cotta Co.; *common bricks*, Summerlee Brick Co.

Scottish Provident Institution Building.

This building occupies a site in St. Vincent Street close to George Square, the frontage to St. Vincent Street being 133ft., and 80ft. to North Court. At the present moment only one wing is complete. A view of this, in comparison with the whole design, is given on the next page. The building is seven storeys in height. The centre portion of the street floor will be occupied by the Institution's office, and the rest of the building is intended for public offices. The first three storeys are rusticated and surmounted by a balcony. The two ends of the façade are finished in advance of the centre portion, and above the balcony they are treated with columns which run up through three storeys. Above this level is the main entablature, and surmounting same is an attic storey and balustrade. The building is designed in late French Renaissance style, the architect being Mr. J. M. Dick-Peddie, of Edinburgh.

The following is the list of contractors (of Glasgow, except where otherwise stated) :—

Mason work, J. Paterson & Son, Ltd.; *joiner work*, John Cochrane, junr.; *plumbing*, James Symington; *plastering*, George Rome & Co.; *slating*, John McOuat & Sons; *concrete floors*, Stuart's Granolithic Stone Co., Edinburgh; *ironwork*, P. & W. McLellan; *glazing*, C. & J. Malloch; *heating*, Mackenzie & Moncur, Edinburgh; *passenger elevator*, Otis Elevator Co.; *tile and marble work*, Galbraith & Winton. *Inspector of works*, Mr. John Currie.

National Bank of Scotland, St. Vincent Street.

At the corner of St. Vincent Street and Buchanan Street is a large building of the National Bank of Scotland, having a frontage to the former of 102ft. and to the latter of 104ft., the main entrance to the bank being in St. Vincent Street. The bank telling-room occupies on the street floor the space which is used as a light well for the offices on the floors above. This room is surrounded with coupled marble columns supporting a deeply coffered ceiling with a dome in the centre. The rest of the street floor is occupied by shops, entered from Buchanan Street. The building is designed in Italian Renaissance style, the first two storeys being rusticated and surmounted by a balustrade. The corners are treated as gables, with coupled columns running through two floors. The main entablature rests on these columns, and above an attic storey and balustrade run round the building. The entrance to the bank is very imposing, having the Royal arms of Scotland set beneath a large pediment flanked by coupled columns (see page 264). Mr. J. M. Dick-Peddie was the architect.

The following were the contractors for the building (of Glasgow, except where otherwise stated) :—

Mason work, P. & W. Anderson; *joiner work*, James Morrison; *plumbing*, James Symington; *plastering*, John McKenzie; *painting*, J. Bennet & Son; *slating*, Hamilton & Co.; *marble work*, Galbraith & Winton; *scagliola work*, Bellman, Ivey & Carter, London; *two electric elevators*, Otis Elevator Co., London; *electric lighting*, Claud Hamilton & Co.; *heating*, Mackenzie & Moncur, Edinburgh. *Inspector of works*, Mr. John Currie.

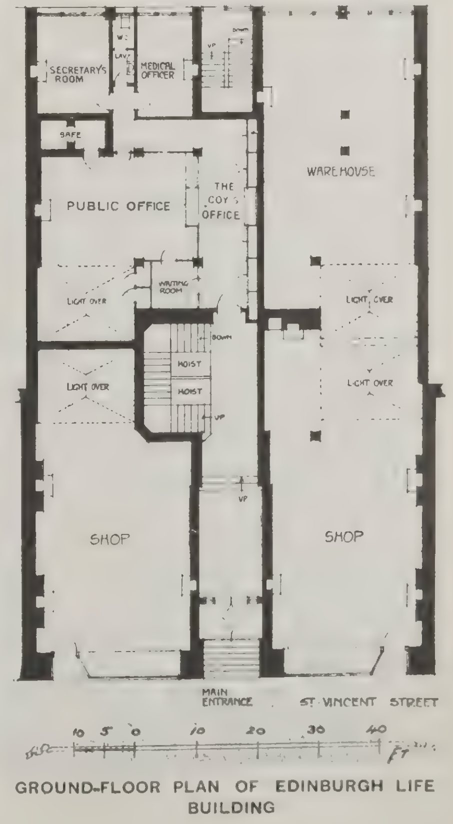
MAIN ENTRANCE.



GROUND-FLOOR PLAN OF EDINBURGH LIFE BUILDING

Savings Bank at Anderston.

This building was completed in 1902. We cannot say that we like it unreservedly, because it has several features which strike us as being carried to excess, but there are many new *motifs* in it which are the outcome of considerable thought and ability: the entrance, for example, where the carving is by Mr. Albert Hodge. Considering work of this kind, one must always remember that it is a great deal easier to be conventional than to be fresh. For our own part, however, we vastly prefer a building which shows some attempt at individual treatment—even though it may be strange—than one of those "safe classic" designs which are the stock-in-trade of several well-known architects. Let some of the "correct" detailing on buildings of the latter class, "eminently respectable," be compared with the detailing on a building like this bank at Anderston. It will be evident how much superior the latter is.

The building is of red sandstone finely tooled, and is roofed with slates. The bank occupies the greater part of the ground floor, with strong-room, heating chamber and lavatories in the basement. A shop and saloon are also provided on the ground floor, while on the upper floor are nine apartment houses. The cost of the building was about £12,000.

The following is the list of contractors (of Glasgow, except where otherwise stated):—

Mason work, &c., John Kirkwood; *joinery*, James Morrison & Sons; *plumbing*, Wm. Anderson; *plastering*, George Rome & Co.; *slating*, J. McOuat & Son; *painting*, George W. Sellars; *tile and marble work*, Galbraith & Winton; *electric lighting of bank*, McAulay Clark & McLaren; *electric lighting of houses and shops*, Johnston Park & Co.; *electric fittings*, Holland House E. M. Co., Ltd.; *heating*, James Combe & Son; *hydraulic hoists in bank for books, &c.*, A. & P. Steven; *revolving door at bank entrance*, Van Kannel Revolving Door Co., Ltd., London; *blinds*, John Bryden & Sons; *mosaic work in bank entrance*, British and Italian Mosaic Co., Ltd.; *wrought ironwork*, Geo. Adam & Son; *safe doors*, Wm. Paterson & Son. *Clerk of works*, Mr. Alex. McLay.

At Govan the branch of the Glasgow Savings Bank has been rebuilt, and was opened last week. The illustration on the next page shows the building. The ground-floor storey is faced with polished Peterhead granite, and the upper portion with red Locharbriggs sandstone. The tower is somewhat novel, the upper part being elliptical. Mr. Eric A. Sutherland, of Glasgow, was the architect.

New Bank in St. Enoch Square.

In St. Enoch Square another new building is in course of erection for the National Bank of Scotland. The bank occupies the ground floor and basement, while above are five floors of warehouses. The main front is constructed of stone, faced on the ground floor with dull-polished Peterhead granite, and above with Plean stone—a close-grained white freestone from Stirlingshire. With the exception of this front, the construction is entirely of steel framing, which is encased with concrete. Floors are of reinforced concrete beams

combined with flat tubular lintels, also of concrete. The front Mansard roof is constructed of steel, with wood purlins, and the back roof of reinforced concrete, covered with Val de Travers asphalt. The window casements of the Bank are in bronze, with lettering shield and bosses of the same material over and around the entrance: elsewhere all sashes are of steel, glazed with plate glass. The floor of the public space in the banking room is finished in marble mosaic in black and white, the walls are panelled in plane-tree wood and Spanish mahogany, and the fittings themselves are of the latter wood with green Elterwater stone base. The architect is Mr. A. N. Paterson, M.A., A.R.I.B.A., with whom was associated, as consulting engineer, the late Mr. C. R. Bonn, who, in this, as in all his work, displayed exceptional ability in the steel construction and design, and whose services in this connexion will be much missed in Glasgow and the West of Scotland. The figure sculpture is being carried out by Miss Archibald, who has recently executed the monumental figures over the entrance of Messrs. McGeoch's warehouse, referred to later.

The following are the contractors for the building (of Glasgow, except where otherwise stated) :—

Mason work, Alex. Muir & Son; *wright work*, Wm. McCall & Sons; *plumbing*, James Johnston & Son; *iron and steel work*, Redpath, Brown & Co., Ltd.; *bank linings and fittings*, John Reid & Son; *plasterwork and granolithic paving*, John Forbes; *slating*, Hamilton & Co.; *glazing*, Wm. Meikle & Sons; *painting*, J. B. Bennett & Sons; *tile and marble work*, Galbraith & Winton; *lifts*, A. & P. Steven; *steel sashes*, F. Braby & Co., Ltd.; *granite work*, Alex. McDonald & Co., Ltd., Aberdeen; *fire-resisting flooring*, Wm. Little & Sons, Ltd., Edinburgh.

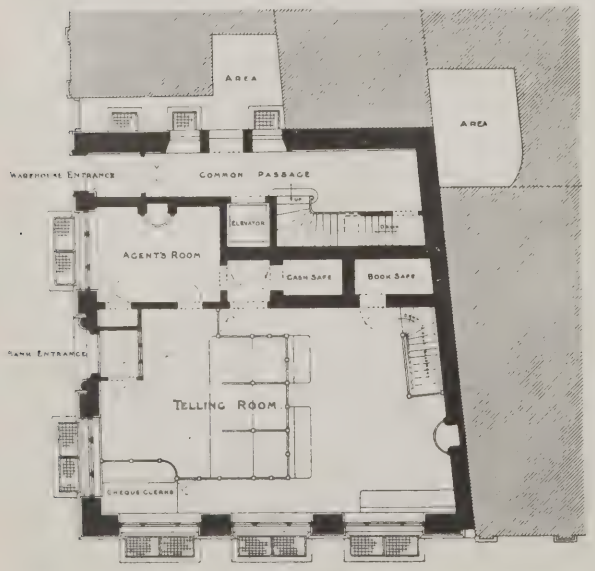
NATIONAL BANK OF SCOTLAND, TRONGATE AND GLASSFORD STREET.
THOMAS P. MARWICK, A.R.I.B.A., ARCHITECT



Trongate.

New Bank in Trongate.

At the corner of Trongate and Glassford Street a building for the National Bank of Scotland has been erected. Mr. Thomas P. Marwick, of Edinburgh, was the architect. The site possesses some little historic interest, as on it stood the east wing of the Shawfield mansion where Prince Charles Stuart resided in 1745. The ground occupied by the new building is comparatively small, being only about 46ft. square, and the bank itself occupies nearly the whole of the street and basement floors. The design is treated with horizontal bands of masonry. The corners are emphasised by turrets, between which are dormer windows flanked by sculptured figures, the whole being crowned with a steep pyramidal roof. The walls are of light-coloured sandstone from the Plean quarry. The sculpture and carving work is by Mr. W. Birnie Rhind, R.S.A.

The contract was carried out by Messrs. Alex. Muir & Son, the sub-contractors being :—

Carpenter and joiner work, James Morrison; *plumbing*, W. Anderson; *plasterwork*, George Rome & Co.; *slating*, J. McOuat & Co.; *painting*, J. B. Bennet & Sons; *marble and tile work*, Galbraith & Winton; *fire-resisting floors*, Rud. A. Stoffert; *leaded glazing*, Meikle & Son; *heating*, Mackenzie & Moncur; *electric lighting*, W. Bryden & Son; *safes and safe doors*, Chatwood, Ltd.; *lift*, Otis Co.

British Linen Bank.

At the corner of Queen Street and Ingram Street is a large building of the British Linen Bank, which has been remodelled, and has had two storeys and staircase added under the direction of Messrs. Salmon and Son and Gillespie, of Glasgow. The view on the next page shows the building as it was when the new work was completed last year. Since then a preservative liquid has been applied to the stonework, and the upper storeys, with the end portion on the Queen Street elevation, now look as blackened as the rest of the building (which was erected sixty years ago). In this bank Messrs. Salmon and Son and Gillespie had of course to make their new work in conformity with the old.

The following is the list of contractors (of Glasgow, except where otherwise stated) :—

Mason work, Alex. Muir & Sons; *joinery and slating*, Wylie & Lochhead, Ltd.; *plumbing*, Wallace & Connell; *plastering*, D. & J. MacKenzie; *painting*, C. T. Bowie Fisher & Co.; *tile and marble work*, Galbraith & Winton; *heating*, James Combe & Son; *electric wiring*, Anderson & Munro; *electric passenger lift*, R. Waygood & Co., Ltd., London; *lift enclosures, wrought iron gates,*

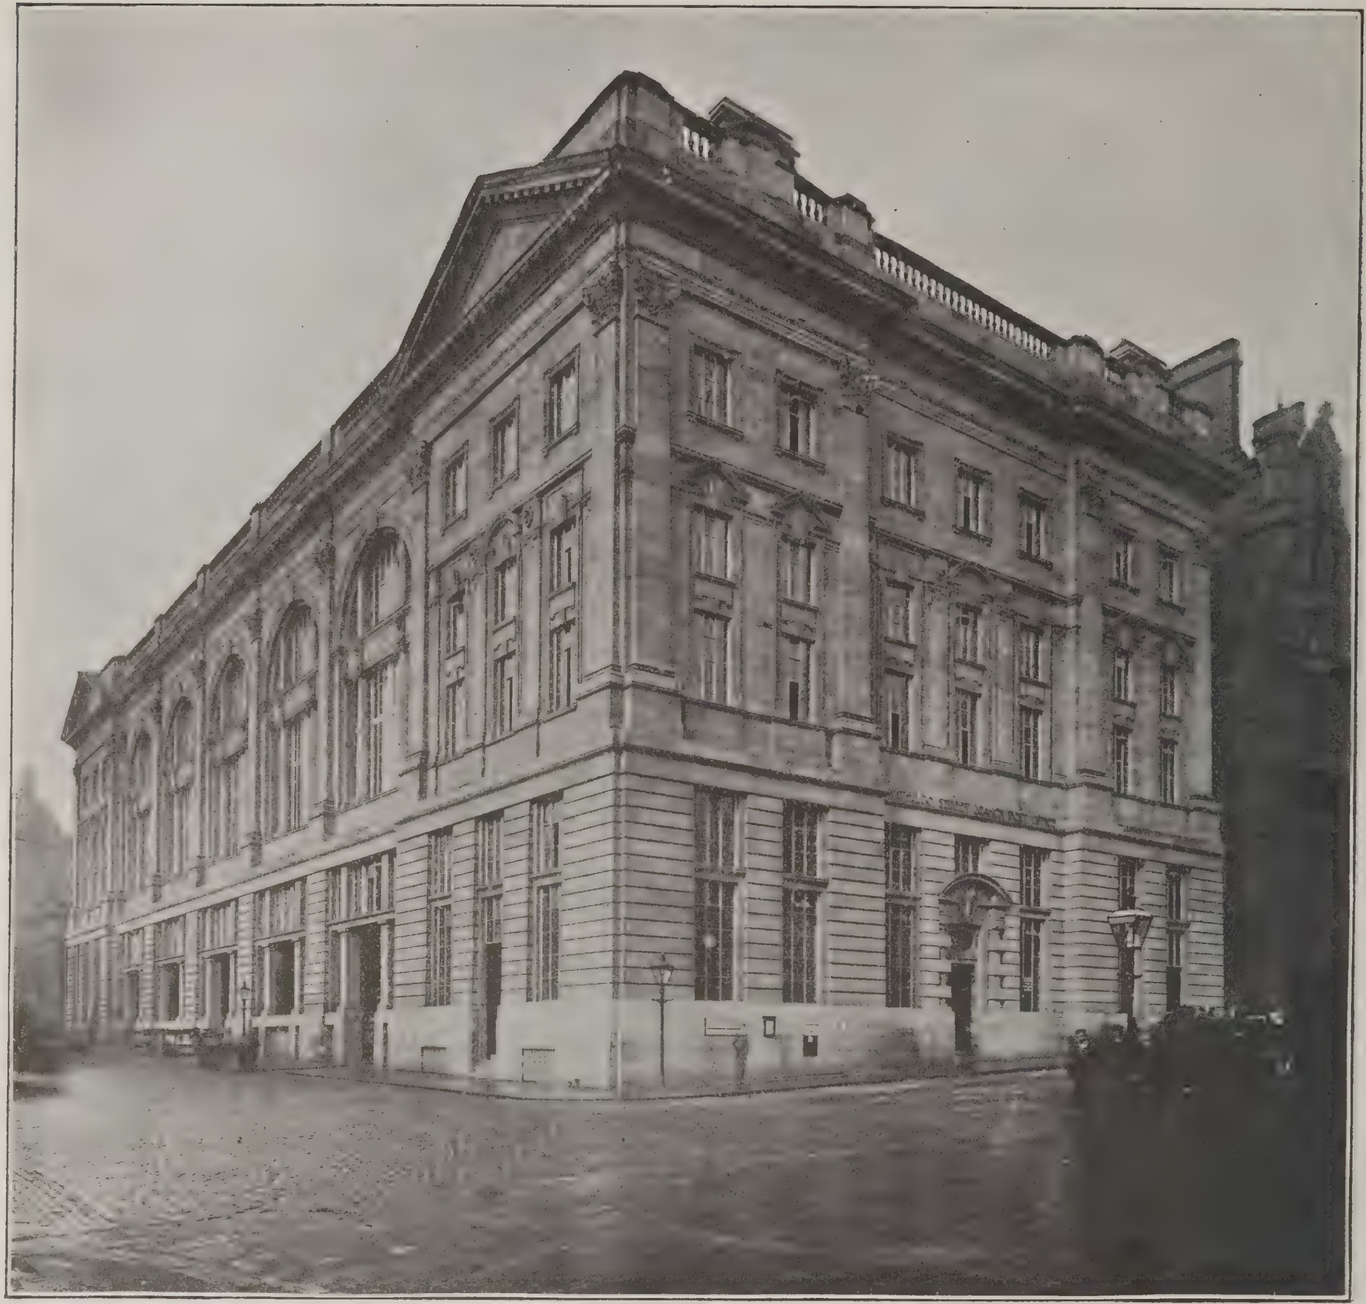
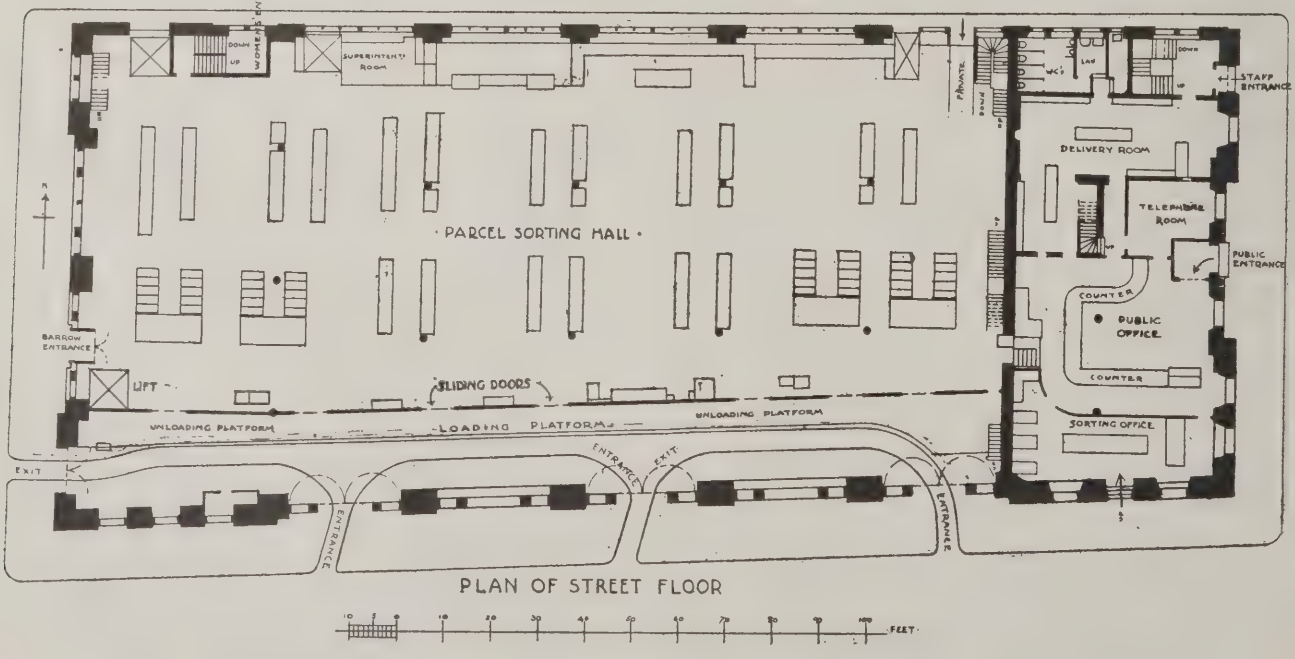
stair railings, &c., George Adam & Son; *hydraulic book lift for bank*, A. & P. Steven; *ventilating fans*, James Keith & Blackman Co., Ltd.; *ironmongery*, J. L. McIndoe & Co.; *stone carving*, George Gregory and Richard Ferris; *sculpture work*, Johan Keller; *grates, &c.*, J. Caird Parker & Co.; *grate and lamp in bank telling room*, Bromsgrove Guild, Bromsgrove; *safe doors in offices, &c.*, Donald Clerk & Son, Ltd. *Clerk of works*, Mr. Alex. McLay.

The new Parcels Post Building.

To cope with the increase of postal business in Glasgow, additions have been made from time to time to the General Post Office in George Square, but there was a limit to the space available for extensions, and eventually it was decided to remove the parcels-post work to a new building on a site in Waterloo Street, about half-a-mile westward. Though nominally only three storeys, the building rises to a general height of 91ft. above the pavement, this unusual height being due to the large areas of the sorting halls, necessitating a head-room of 25ft. With the exception of a small portion on the Wellington Street side used as a branch post-office, the whole of the street floor is occupied as a sorting hall, with a loading platform and covered van-way 180ft. long entered from Waterloo Street through archways. Here all parcels will be received, handled by the sorters on this floor, or shot up on one of the four electric lifts to the sorters on the first floor, and returned to the loading platform ready for the delivery vans. The sorting hall on the first floor has a floor area of 18,715ft. super. The second floor of the building is at present unappropriated. These great apartments are well lighted by large windows on three sides, with top-lights on the upper floor. The walls are lined from floor to ceiling with ivory white glazed bricks, having skirting and cornice picked out in colour. Floors are of wood blocks. On the Wellington Street side, above the branch post-office, are four floors occupied mainly by the postal engineers' and other departmental offices, together with cloakroom and lavatory accommodation; a large dining-room with kitchen and servery are also provided. Under the whole building is a high, well-lit basement, divided up for the various departmental stores, the electric lifts running down to same. The building is of fire-resisting construction throughout, and is faced with a cream-coloured freestone from Northumberland with a high granite plinth: the stonework has been treated with preservative solution to withstand the Glasgow atmosphere. The main front is divided into five arched bays, each 32ft. wide by 72ft. high, with a pedimented wing at each end. The building has been erected from designs prepared in H.M. Office of Works, Edinburgh, under the direction of Mr. W. W. Robertson, H.M. late Principal Architect for Scotland, amended and carried out by Mr. W. T. Oldrieve, H.M. present Principal Architect for Scotland. The total cost will be about £80,000. The general contractors are Messrs. P. & W. Anderson, of Glasgow, the clerks of works being Mr. James Hislop and Mr. G. H. Daymond. The sub-contractors are as follows (of Glasgow, except where otherwise stated):—

Joinery, John Cochrane; *cast-iron work*, Campbell, Binnie & Co.; *steelwork*, Redpath, Brown & Co.; *stone carving*, Holmes & Jackson; *plumbing*, Wm. Anderson; *plastering*, McGilvray and Ferris; *painting*, Charles Carlton & Sons; *glazing*, W. Meikle & Son; *fittings*, J. & T. Scott, Edinburgh; *heating*, Charles Ritchie & Co., Edinburgh; *window casements*, George Wragge, Ltd., Manchester; *wood-block flooring*, E. B. Burgess & Co., Liverpool; *electric lighting*, John Finlay & Co.; *lifts*, A. & P. Steven; *revolving shutters and collapsible gates*, The Folding Gate Co.; *wrought-iron gates and grilles*, Charles Henshaw, Edinburgh; *pavement and stall-board lights*, Thaddeus Hyatt & Co., London.





NEW PARCELS POST BUILDING, WATERLOO STREET. W. T. OLDRIEVE, H.M. PRINCIPAL ARCHITECT FOR SCOTLAND.

District Hospitals.

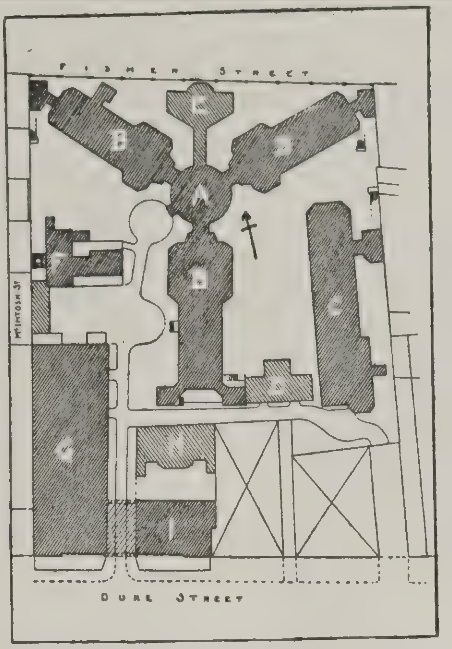
Three large district hospitals have been provided in Glasgow within the last few years—the Stobhill (or Central), the Eastern, and the Western.

The Stobhill Hospital was completed last year, Messrs. Thomson and Sandilands, of Glasgow, being the architects. The design was the outcome of a competition. Provision is made for about 1,650 patients. There are beds for over 800 cases in the hospital proper; accommodation for nearly 600 children; and four wards, containing 240 beds, for ordinary infirm cases of both sexes. The scheme combines therefore a hospital and an infirmary. The total cost was more than £300,000.

The Western District Hospital was completed in 1904. It is planned for 205 patients, made up as follows:—Receiving block 6, medical block 112, surgical block 50, maternity block 37. Owing to the restricted width of the site, considerable difficulty was experienced in placing the blocks so as to meet the requirements of the Local Government Board; the key plan on the next page shows how the difficulty has been overcome. The walls are of brick, with a 2½-in. air-space. Throughout the buildings fire-resisting construction has been adopted. Ward floors are of maple, wax polished, and walls and ceiling finished with Keene's cement. Heating and ventilating is partly by air forced in by fans and partly by air-inlets with radiators directly over them; foul air being extracted through ducts at the side of the chimney flues. The architect of this hospital was Mr. Alex. Cullen, of Glasgow.

The following is the list of contractors (of Glasgow, except where otherwise stated):—

Mason and brickwork, John Paterson & Son, Ltd.; *joiner work*, Andrew Meiklejohn; *slating*, A. Robertson; *plumbing*, R. S. Renfrew; *plastering*, David M'Nair, Falkirk; *tiling*, Cherry & Co.; *heating and ventilating*, Steel & Wilson; *painting*, M'Culloch & Co.; *electric lifts*, Archibald Smith & Stevens, London; *smoke-preventing apparatus*, Robert Brown; *laundry machinery*, D. & J. Tullis, Ltd.; *cooking machinery*, A. & J. Main, Ltd., Falkirk; *electric lighting*, M'Culloch, Potter & Co.; *boilers*, Penman & Co.; *telephones*, National Telephone Co.

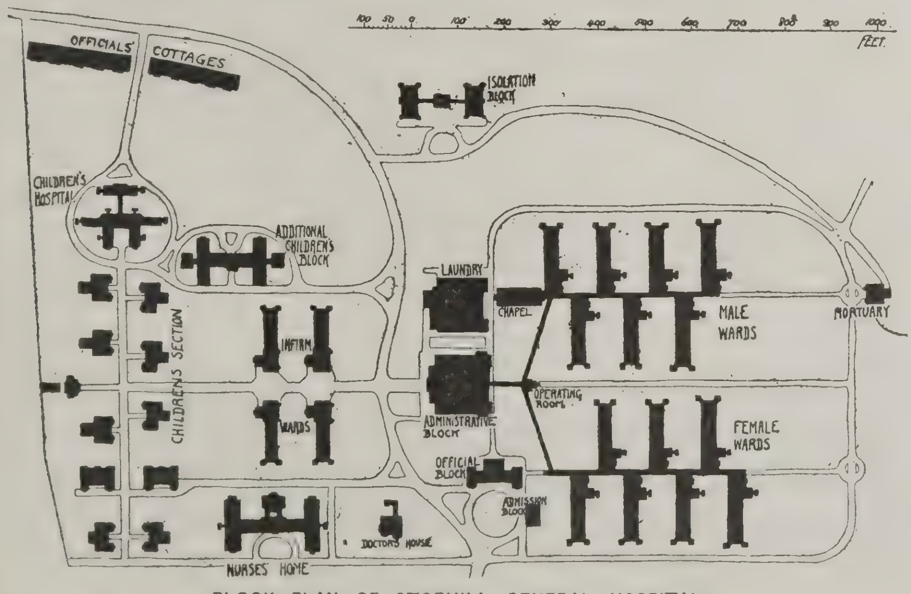


BLOCK PLAN OF EASTERN DISTRICT HOSPITAL; A, staircase block; B, B, B, ward blocks; C, mental block; D, mortuary: E, operating theatre: F, isolation block; G, administrative block; H, probationary block; I, staff block.

The Eastern District Hospital provides accommodation for 244 patients—133 males and 111 females—the male wards being for 72 medical, 25 surgical, and 7 skin cases, and the female wards for 36 medical, 25 surgical, 7 skin, 10 children, and 4 maternity cases. Beds are also provided for 44 mental cases. In addition there are the usual isolation blocks, operating theatre, mortuary, &c., together with a large administration block (shown in the view on the next page). Here, as at the Western Hospital, the restricted nature of the site made it difficult to plan the buildings satisfactorily. Mr. Hessell Tiltman, the architect, adopted the radial system for the ward blocks, in order to secure the maximum amount of sunshine and air.

Western Infirmary.

At the Western District Infirmary, where Mr. J. J. Burnet, of Messrs. John Burnet & Son, has done such masterly hospital work, in altering and adding to his father's design to meet more modern requirements, a new wing has recently been completed; it was opened last month. This new wing consists mainly of three large wards, 81ft. by 28ft. by 14ft. 8ins., with appurtenant rooms. The wards are tiled for a height of 6ft. 6ins., and finished above in Parian cement, enamelled: ceilings are concave. Floors are of fire-resisting construction and covered with polished teak blocks. Heating is on the "Reck" system, a radiator being fixed under each window, with direct air inlet, and a slow-running fan provided at the top of the building for extracting the vitiated air. Two towers at corners of the wards serve as sanitary annexes, being connected to the wards by cross-ventilated passages. The baths are of a special pattern, and the Glasgow Western Infirmary is the first institution in which they have been used. The bath is of enamelled iron and turns on a swivel at the tap, water being supplied from a fitting on the wall, which has a special mixer worked by a key. This form of bath enables every part of the room to be kept clean.



BLOCK PLAN OF STOBHILL GENERAL HOSPITAL.

The Royal Infirmary.

A large work now in progress is the rebuilding of the Royal Infirmary. This building has been the occasion of a considerable amount of feeling. It will be remembered that a competition for the design was held about six years ago, after the Managers had for two years been trying to get what they wanted from an architect selected by themselves. In the competition ten architects were invited to submit designs, and the committee drew up on its own account two "suggestive" sketch plans, an essential feature of both of which was the "Jubilee" block facing Cathedral Square. Most of the competing architects, however, considered this arrangement to be so undesirable, for reasons of light and air, that they found it necessary to depart from the committee's ideas. Sir Rowand Anderson was the assessor, and he made a short leet of four and selected one. The Managers, however, threw over his award and selected the design of Mr. James Miller, which followed the committee's own arrangement. The building faces the ancient cathedral of Glasgow, and will have a frontage of about 600ft., with a depth of 200ft. There will be six floors and basement, with provision for about 670 beds. The portion now being proceeded with is the northern wing of the building, and it is expected to be completed in 1908. The total cost of the scheme is put at over £400,000, which includes a new gatehouse block, pathological building, isolation block, new laundry and power station, dispensary and extension to nurses' home.

Stock Exchange Extension.

In St. George's Place an extension has been made to the Glasgow Stock Exchange. It was opened last April. In its architectural treatment the extension follows the lines of the main building, which is of uninteresting French Gothic type, and was designed by Mr. John Burnet, the founder of the present firm of John Burnet & Son. The ground floor is occupied by offices and a post-office. On the first floor is the new mining market, with telephone corridor and smoking-room. The mining market is 50ft. by 42ft. by 22ft. high, lighted by three windows into St. George's Place. It has more than double the area of the old market, and will eventually be thrown into the present general market. The telephone corridor is more than 100ft. long, and the floor is laid with india-rubber. On the second floor of the building are general office, secretary's room, &c., and on the third floor telegraph instruments room, committee room, and offices. The building is heated on the "Reck" system, and all floors are served by Otis lifts. The architect was Mr. J. J. Burnet.

Warehouses.

The warehouses of Glasgow are notable as excellent examples of their class. They are designed on purely utilitarian lines, but there is a sturdy quality and good proportion about them which calls for special attention. A good recent example is that erected for Messrs. Fraser, Ross & Co., Ltd., in Ingram Street, from designs by Mr. H. E. Clifford see next page). The building does not need lengthy description. The plan, it will be seen, is quite straightforward, and the exterior expresses the plan. Window spacing has been carefully studied, and in each storey the daylight of the windows is flush with the ceiling. The building is erected of Locharbriggs red freestone, and the floors throughout are of "Fram" fire-resisting construction.

The following is the list of contractors (all of Glasgow) :—

Mason work, Alex. Muir & Sons; *wright work*, Sutherland & Leslie; *plumbing*, Moses Spiers & Son; *plastering*, A. Calders & Son; *slating*, John McOuat & Son; *cast-iron work*, M. McCulloch & Co.; *wrought iron work*, Bladen & Co.; *fireproof flooring*, Rud. A. Stoffert.

"Neptune Buildings," at the corner of Argyle Street and Pitt Street, is another good example (see page 261). The architect was Mr. P. Macgregor Chalmers, of Glasgow. The corner of the building has been designed as a bank, and two shops occupy the remainder of the Argyle Street frontage, but the floors above are all devoted to warehouse work. The entrance to the stair and hoist for the upper floors is in Pitt Street. The construction is fire-resisting throughout. The cost of the building, including the alteration of the adjoining property, has been about £11,000.

The following were the principal contractors (all of Glasgow) :—

Mason work, Paterson & Son; *steelwork*, Redpath, Brown & Co.; *fire-resisting floors*, Fergusson & Allan; *steel casements*, Henry Hope & Son, Birmingham; *joinery*, Miller & Murray; *plumbing*, Renfrew & Newall; *plastering*, John Drummond; *glazing*, Meikle & Co.; *asphalt*, Limmer Asphalte Paving Co.

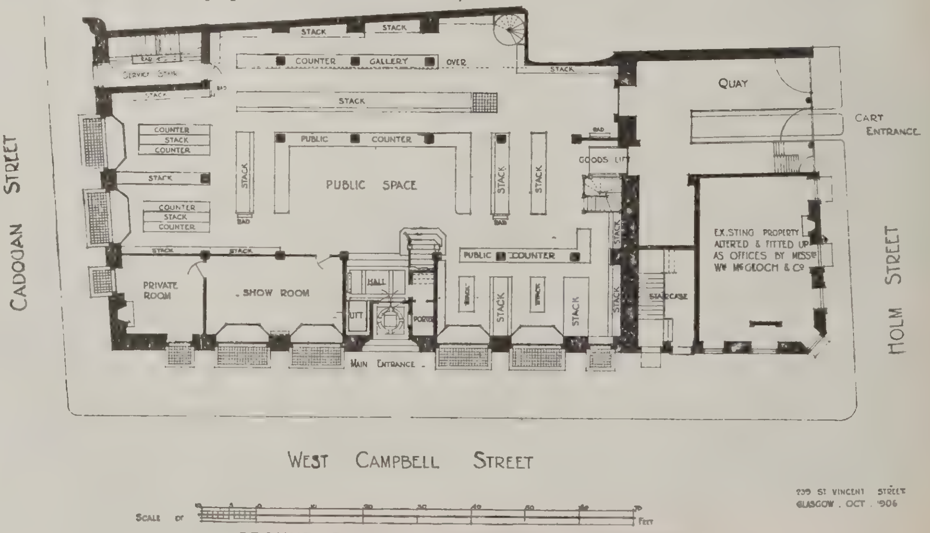
McGeoch's Warehouse.

A notable new warehouse is that now being completed in West Campbell Street and Cadogan Street, for Messrs. William McGeoch & Co., Ltd., dealers in ironmongery, electrical goods, &c. Mr. J. J. Burnet, of Messrs. John Burnet & Son, of Glasgow, is the architect. The building is of red sandstone, and comprises six storeys and basement, a portion of the latter being fitted up as a workshop. In designing the structure the keynote has been efficient lighting of the various floors. With that object in view, the front is divided into a series of bays formed by vertical piers—a striking architectural treatment. The detail inclines towards French Renaissance. The main entrance is centrally placed on the West Campbell Street front, and has a curved pediment with recumbent figures of "Science" and "Industry." Importance is also given to the corner by a circled tower corbelled out, with a winged figure at the base representing "Art."

The following are the contractors for the building (of Glasgow, except where otherwise stated) :—

Mason work, Alex. Muir & Sons; *wright work*, Andrew Meiklejohn; *plumbing*, Alex. Anderson; *glazing*, C. & J. Malloch; *plastering*, George Rome & Co.; *painting*, John Orr & Sons; *fireproof flooring*, Columbian Fireproofing Co., Ltd., London; *heating*, Simpson & Farmer; *tile and marble work*, Galbraith & Winton; *passenger lift*, R. Waygood and Co., Ltd., London; *hydraulic goods lift*, A. & P. Steven; *sculptor work*, Miss Archibald and Holmes & Jackson.

In Robertson Street a new building for Mr. R. E. Buchanan has been erected from designs by Mr. John A. Campbell. The view on page 261 shows the building. The main doorway, an interesting treatment, is illustrated on this page.



GROUND FLOOR OF McGEOCH'S WAREHOUSE.

Messrs. Annan's new Premises.

For Messrs. T. & R. Annan & Sons, the well-known photographers, a new building has been provided in Sauchiehall Street. The front is of red sandstone from Dumfries quarry, and is embellished at third-floor level with two large figures carried on corbels. The ground floor of the building is occupied as a large showroom and saloon, the back portion being devoted to printing rooms in which the firm carries out photogravure and other process work. From the ground floor access is given by a lift and staircase to the studio above and to the upper floors of the building. Messrs. Honeyman, Keppie and Mackintosh were the architects.

MISS CRANSTON'S RESTAURANT, SAUCHIEHALL STREET. HONEYMAN, KEPPIE AND MACKINTOSH, ARCHITECTS.

Miss Cranston's new Restaurant.

In Sauchiehall Street another of Miss Cranston's renowned tea-rooms has been completed within the last year, the architects being Messrs. Honeyman, Keppie & Mackintosh. The building is not a new one, but a reconstruction of an old warehouse. The front is finished white, and both inside and outside the building is characteristic of its architect. The ground floor is occupied as a tea-room, with a gallery at the back around the saloon; on the first floor is a ladies' room, known as the "Room de Luxe"; and on the top floor is a billiard-room. The kitchens are on the ground floor.

GOLFHILL PUBLIC SCHOOL, DENNISTOUN. ALEXANDER N. PATERSON, M.A., A.R.I.B.A., ARCHITECT.

Schools.

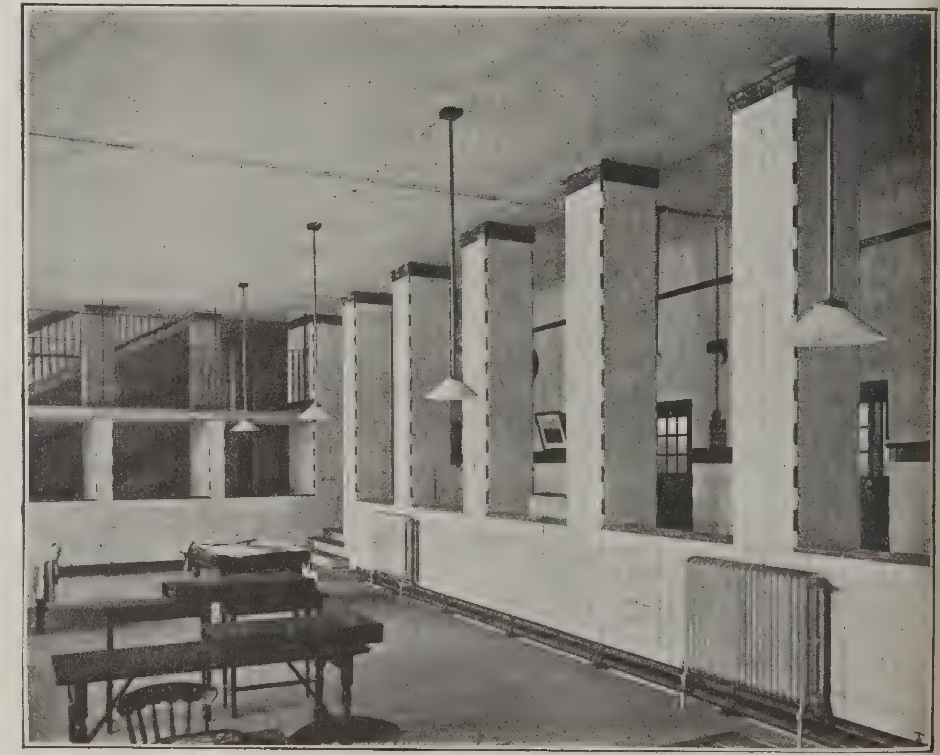
Within the five years with which we are now dealing many new schools have been erected in Glasgow. We do not propose, however, to attempt any complete list of them, as it would serve no useful purpose, but we show herewith four which may be taken as representative of the buildings provided. These are at Dennistoun, St. Rollox, Dalmuir, and in Scotland Street.

The Golfhill public school at Dennistoun is a mixed elementary school with accommodation for 1,500 children. After the arrangement common to most of the schools erected for the Glasgow Board, it has a large central hall rising through all the floors, with the classrooms grouped round it—in this case on the south-west and east sides only, so that the hall, in addition to the usual roof light, has a large five-light window at the north end. Boys' and girls' staircases are provided at the west and east ends respectively, and a wide double stair is placed at the north end of the hall, rising to the gallery on the first floor. The infants' department occupies the south and east portions of the ground floor. A house for the janitor is provided at one corner of the playground, and playing sheds and latrines for boys, girls and infants are placed along the north wall of the playground. The walls are constructed of Locharbriggs freestone from Dumfriesshire, and the roofs covered with Aberfoyle grey slates. The sliding partitions, screens, and internal finishings generally are of canary wood, the open-timbered roof to the central hall being of pitch-pine. The lower walls of hall, galleries and staircase, as well as lavatories and cloak-rooms, are lined with tiles. The total cost of the school was a little under £20,000, including about £1,000 spent in piling the ground to a depth of 40ft. under all the walls of the building, the site having been found to cover the centre of an old quarry filled up to that depth.

The following is the list of contractors (of Glasgow, except where otherwise stated):—

Mason work, James Parker; *iron and steel work*, Redpath, Brown & Co., Ltd.; *wright work*, A. Meiklejohn; *smith work*, McCallum & Hope; *plastering*, Joseph Graydon; *plumbing*, Fyfe & Allan, Ltd.; *tiling*, Haddow, Forbes & Co.; *glazing*, George G. Kirk; *cement pavior work*, William Forbes; *heating, &c.*, Hunter, McWilliam & Blair; *ventilation*, Cousland & Mackay; *slating*, W. & D. Mailer; *gasfittings*, H. Tosh, Sons & Cross; *stair railings*, John Craig; *patent roof glazing*, Henry Hope & Sons, Ltd., Birmingham; *wood block flooring*, Geary, Walker & Co., London; *Stott Thorpe lights*, James Stott & Co.; *ironmongery*, Fletcher, Parker & McAlpine.

The St. Rollox public school, in a congested district of the city, is of the corridor plan, which, owing to the character of the site, gives a four-storey frontage to the north, in Garngad Road, and a three-storey one to the south. Three large playgrounds for boys, girls and infants are provided, each having ample shed and latrine accommodation. The school is 180ft. in length, and the corridor, which runs from end to end, is 10ft. wide, with seven classrooms opening off it on each floor, all facing the south and so arranged as to give left-side lighting. In the centre of the north elevation is a large projecting block, which provides a hall 50ft. by 40ft. on each floor. These halls are well lighted at the sides and ends, and are suitable for converting into classrooms,



HALL, SCOTLAND STREET SCHOOL. HONEYMAN, KEPPIE AND MACKINTOSH, ARCHITECTS.

if desired. The hall on the top floor is finished with an open timber roof, while on the ground floor it is divided up for manual and laundry classes. The staircases are ample and well lighted, and cloakroom and lavatory accommodation for each sex opens off the main corridor. The staff rooms (with lavatory accommodation) are placed convenient to the entrances. The ventilation of the school is by draught-protecting screens arranged at the windows, the vitiated air being drawn off near the ceilings through ducts by two electric fans in a chamber in the roof, and discharged through louvred openings to the outside. Heating is by low-pressure hot-water piping and radiators. The design of the building is of simple Renaissance type, an unusual feature being that it is built with *polished* rubble and dressings throughout. A house for the janitor occupies a corner of the

girls' playground. This school was built at a cost of £21,720, from plans prepared by Mr. Duncan McNaughtan, I.A., of Glasgow, the clerk of works having been Mr. David Johnstone.

The principal contractors were :—

Mason work, James Parker; *joiner work*, G. & D. Newton; *smith work*, P. & R. Fleming; *steelwork*, P. & R. Fleming; *cast-iron work*, Redpath, Brown & Co., Ltd.; *wood-block flooring*, Geary, Walker & Co., Ltd.; *stair railing*, John Craig; *ironmongery*, J. L. McIndoe & Co.; *glazing*, James Summers; *slating*, Hamilton & Co.; *painting*, James Moodie; *plumbing*, Robert Mason; *plastering*, Kenneth Mathieson; *tiling*, Haddow, Forbes & Co.; *concreting*, William Forbes; *heating*, Hunter McWilliam & Blair.

At Dalmuir an elementary school for children has been erected from designs by Mr. D. Andrew, junr., of Glasgow. The plans on the preceding page show its disposition, on the central hall system.

The school in Scotland Street, on the south side of the river, was completed about six weeks ago. The architects were Messrs. Honeyman, Keppie & Mackintosh, but it is clear that the last-named has controlled the design. We leave the accompanying illustrations to speak for themselves. The school is three storeys high, and has a frontage of 148ft. to Scotland Street. The main entrances for girls and for boys are placed at the right and left of this front, while for the infants there is a separate entrance in the centre. These entrances give access to two spacious staircases, and it is the glazed bays through which these are lighted which give such an unusual appearance to the front. Adjacent to the staircases are lavatories and cloakrooms. The school, it will be seen, is of the corridor type. On the ground floor there are 6 classrooms accommodating 390 pupils; on the first floor 9 classrooms, accommodating 500 pupils; and on the second floor 6 classrooms, accommodating 360 pupils; giving a total accommodation of 1,250. It will be noticed that of these 21 classrooms, 18 face south. On the ground floor a drill hall 58ft. by 25ft. is provided, with 3 classrooms above it on the first floor, and a cookery classroom in the same position on the second floor. In designing the school every effort has been made to arrive at a frank solution of the requirements, the finishings and fittings of the classrooms being of the simplest character, and glazed tiles used as a sanitary finishing to walls and piers. Heating is by low-pressure hot water, and ventilation effected by extract fans in the roof. A janitor's house and the usual children's offices and playsheds are provided within the playgrounds. The total cost of the building has been about £14,740. Mr. J. Montgomery was clerk of works.

The principal contractors were :—

Mason work, G. Barlas & Co.; *joiner work*, William Lightbody; *smith work and steel and iron work*, P. & R. Fleming, Ltd.; *slating*, Hamilton & Co.; *painting*, C. Carlton & Sons; *plumbing*, J. L. Arnot; *plastering*, MacIntyre & Jolly; *glazing*, R. L. Paterson; *paving*, John Forbes; *ironmongery*, McGeoch & Co.; *tiling*, British Art Tileries Co.; *heating and ventilating*, J. Combe & Son; *tar macadamising*, W. G. Walker & Sons; *electric lighting*, J. D. MacKenzie & Co.

Libraries.

The system of public libraries administered by the Glasgow Corporation, under the provisions of a local Act of Parliament, is intended to consist of (1) The Mitchell Library, (2) a series of sixteen district libraries, and (3) two district reading-rooms. Of these there are now open the Mitchell Library, twelve district libraries, and one district reading-room. Buildings for two more district libraries are approaching completion. For the two remaining district libraries sites have not yet been secured. The Mitchell Library (founded in 1874 with a bequest of about £67,000 by the late Mr. Stephen Mitchell, tobacco manufacturer, Glasgow) was opened in temporary premises in 1877 with 14,000 volumes; in 1890-91, when it had increased to more than 80,000 volumes, it was removed to the building in Miller Street it now occupies. The development of the library has been continuous and steady, the number of volumes now contained in it being more than 170,000, and the present building in Miller Street has long been inadequate both for the stock of books and for the accommodation of readers. The Corporation decided therefore to erect a new building on the vacant ground between the St. Andrew's Halls and North Street, the principal elevation being in the latter thoroughfare. The architect is Mr. Wm. B. Whitie, I.A., of Glasgow, whose design was selected from a large number submitted in open competition. The plan on the next page shows the general disposition of the building. The contracts for the erection of the library are now under consideration, and it is expected that building operations will be commenced very shortly.

With regard to the district libraries, we may mention that those now open are at Gorbals, Kingston, Anderston, Woodside, Maryhill, Springburn, Dennistoun, Govanhall, Bridgeton, Parkhead, Hutchesontown and Kinning Park, while those at Pollokshields and Townhead are well advanced towards completion. Each district library has a lending department containing from 7,000 to 13,000 volumes, a large general reading-room, and reading-rooms for ladies, for boys, and for girls, together with the necessary staff and store accommodation. We give on the next page illustrations of the libraries at Woodside, Anderston, Maryhill, Crosshill and Hutchesontown.

(For the foregoing particulars we are indebted to the courtesy of Mr. F. T. Barrett, the City Librarian, who was responsible for the excellent scheme of branch libraries outlined above. The carrying out of this scheme has been largely aided by the gift of £100,000 which Mr. Carnegie made to the Corporation about five years ago.)

Domestic and Church Work.

A good many houses of much interest have been erected in the suburbs of Glasgow within recent years, by such architects as Mr. J. J. Burnet, Mr. James Miller, Mr. John A. Campbell, Mr. H. E. Clifford, Mr. Sydney Mitchell, &c., but we regret we have not space to deal with them now. Of church work not a great deal of importance has been done, but we may mention a new church at Dennistoun by Mr. P. Macgregor Chalmers, and the addition to the Catholic Apostolic Church, in Catherine Street, by Messrs. Salmon and Son and Gillespie.

Between Kilbowie and Dalmuir a very extensive scheme of artisans' dwellings is being carried out by Messrs. Robert McAlpine & Sons—intended to provide accommodation for about 20,000 people. Hundreds of houses have been erected, and it is noteworthy that they have not been built in the usual huddled fashion, but on a generous plan with good air-space and greenery around them.

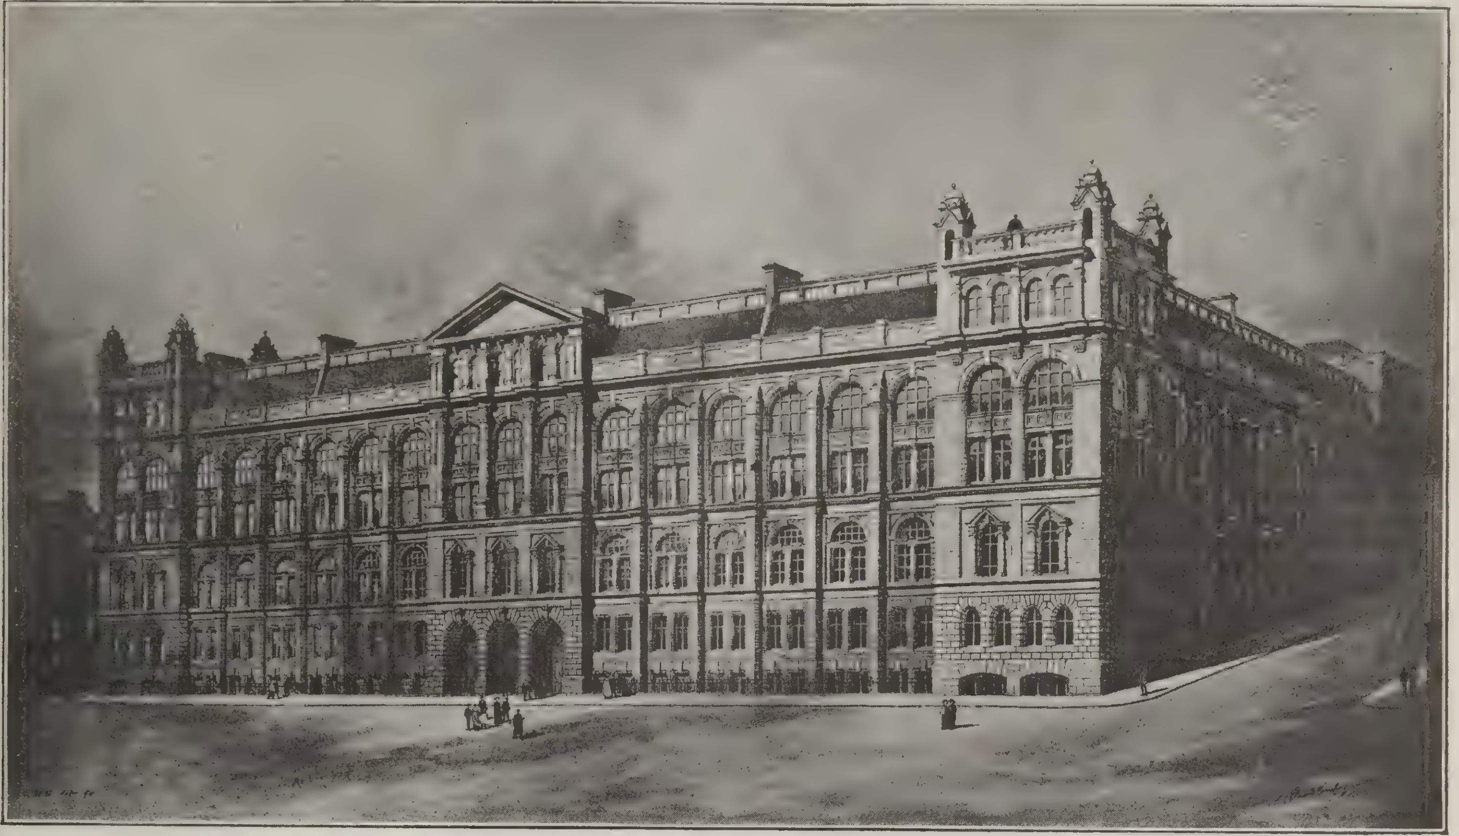
NEW GLASGOW LIBRARIES.



GLASGOW TECHNICAL COLLEGE, GEORGE STREET. DAVID BARCLAY, F.R.I.B.A. ARCHITECT.

Glasgow Technical College.

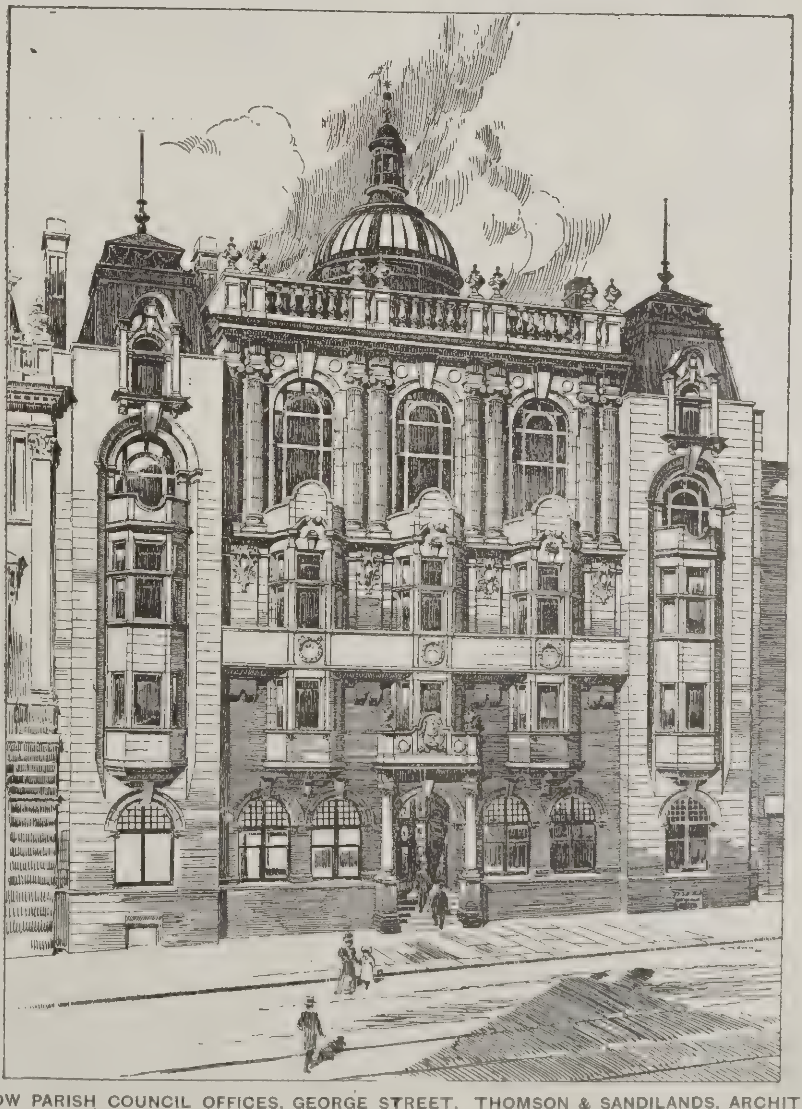
The work of erecting this large new building has been in progress for four years, and at the present moment the five large wings of the college (comprising more than five acres of floor space) have been completed, two parallel to George Street and three at right angles, parallel to Montrose Street. The main front, however, shown in the illustration above, has still to be added. It will be 346ft. long and more than 100ft. high, comprising five floors and a semi-basement. The walls facing the streets are of red Dumfriesshire stone, while all other exterior walls are of white enamelled brick to secure the greatest amount of light to the rooms facing the five interior courts. When complete the building will be among the largest of its kind in the Kingdom. The total cost is likely to be about £300,000. Mr. David Barclay, of Glasgow, is the architect.

The principal contractors are:—

Mason work, P. & W. Anderson; *joiner work*, George Ferguson & Sons; *plumbing*, Ingleton & Co.; *plastering*, McGilvray & Ferris; *painting*, R. & J. Bennet.

Parish Council Offices.

The desirability of unifying the several parish councils of Glasgow having been recognised, it was decided to provide a central building in George Street, for which work Messrs. Thomson & Sandilands were appointed architects. The ground floor of the building is mainly occupied by the entrance hall (with staircase centrally placed), collector's office, and a large hall at the rear, the first floor being apportioned to various departmental rooms. The council chamber is on the top floor. It is expressed on the exterior by the three large windows with coupled columns between, and is crowned by a dome. A view of the main doorway is given on page 264.



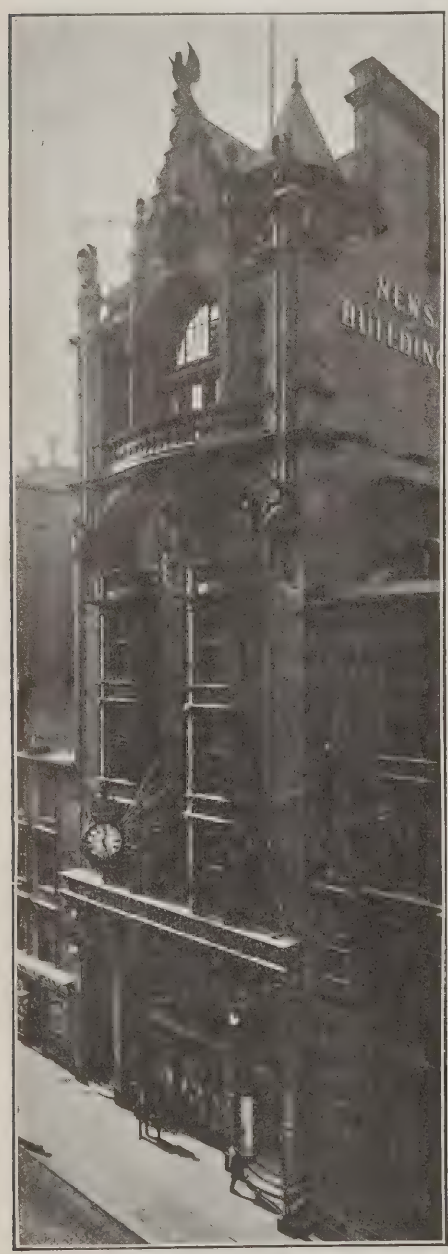
GLASGOW PARISH COUNCIL OFFICES, GEORGE STREET. THOMSON & SANDILANDS, ARCHITECTS.

Office Buildings and Business Premises.

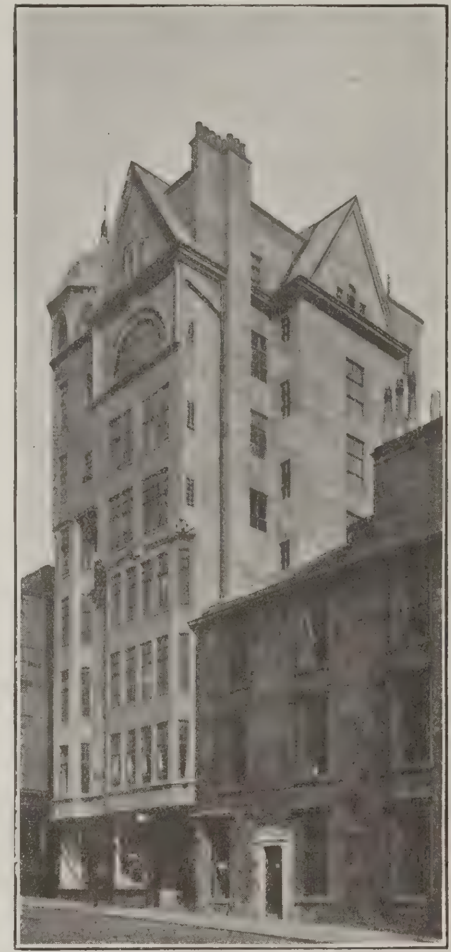
At the corner of West George Street and Hope Street a huge building has been erected from designs by Mr. John A. Campbell. We give a view of it as a centre plate in this issue. The building is carried out in red sandstone. The windows are treated without any sort of moulding, and what embellishment there is on the building is severe and sparse; nevertheless, the effect is not gaunt but impressive, and, we think, very successful. Among the contractors for this large building were the following:—

Mason work, Morrison & Mason, Ltd., Glasgow; *steelwork and fire-resisting floors*, D. Ferguson & Co., Carlisle; *plastering*, George Rome & Co., Glasgow; *electric passenger lifts*, Easton & Co., Ltd., London; *grates*, Well Fire Co., Ltd., Glasgow.

Further up Hope Street is a very high office building built of reinforced concrete on the Hennebique system. The site is only 46ft. by 33ft., while the height of the building is 90ft. from the pavement, and 100ft. from basement level. This great restriction of site-area created many difficulties in carrying out the work, but by ingenious construction they were all overcome satisfactorily. The architects, Messrs. Salmon and Son & Gillespie, have treated the design in conformity with the nature of the material, no effort being made to imitate stone or brick, and we think they have achieved a considerable success. The outer walls and floors are 4ins. thick only—a significant fact: for, if the thickness prescribed by the Building Act had been enforced, the rooms would have been too small for useful occupation. The ground and basement floors are occupied by a firm of stationers and printers, the upper floors being tenanted chiefly by lawyers, and the top floors by artist painters. Lawyers being largely in evidence within the building, we find a reason for the two modelled corbels, representing legal dignitaries, which help to support the main oriel window.



"GLASGOW EVENING NEWS" OFFICE, HOPE STREET. ROBERT THOMPSON, ARCHITECT.



REINFORCED CONCRETE OFFICE BUILDING, HOPE STREET. SALMON AND SON AND GILLESPIE, ARCHITECTS.

Among the contractors for this building were the following:—

Reinforced concrete work, Yorkshire Hennebique Constructing Co., Ltd., Leeds; *fire-resisting partitions*, Stuart's Granolithic Stone Co., Glasgow; *bitumastic enamel on roof*, Wailes, Dove & Co., Newcastle-on-Tyne; *electric elevator and enclosures*, A. & P. Steven, Glasgow; *grates*, Well Fire Co., Ltd., Glasgow; *stoves*, Carron Co., Carron.

In Hope Street new premises have been erected for the "Glasgow Evening News" from designs by Mr. Robert Thompson.

At 144, St. Vincent Street is a very high and narrow block of offices by Messrs. Salmon and Son & Gillespie. A very large amount of window space was required. The accompanying illustration shows how this has been provided.

A large block has been erected with frontages of 130ft. each to Mitchell Street, Mitchell Lane and Gordon Lane. The building is eight storeys high, including basement, and has four entrances, with four passenger and goods lifts. The roof is flat, and all staircases are taken up to it, communicating with one another so that any staircase can be used as an exit in case of fire. The basement is occupied as a billiard saloon and for wholesale stores. The ground floor is let as motor-car showrooms, with licensed premises at the corner of Gordon Lane, and the upper floors are let as offices in the front buildings and as warehouses at the back. Messrs. Frank Burnet, Boston and Carruthers, of Glasgow, were the architects.

SHOPS AND FLATS, POLLOKSHAWS ROAD. JOHN NISBET, ARCHITECT.

Large halls have been built for the Co-operative Society on the south side of Glasgow, by Messrs. Bruce and Hay.

New headquarters for the 4th Battalion Royal Scottish Rifles have been erected in Taylor Street at a cost of about £5,000. The architects were Messrs. John McKissack & Son.

At Anniesland, on the western side of Glasgow, are new printing works and offices for Messrs. Robert McLehose & Co., Ltd. Mr. Alexander N. Paterson, of Glasgow, was the architect. A view of the entrance doorway to the office block is given on page 265.

In Pollokshaws Road, overlooking Camphill Park, a five-storey block of flats with roof garden has been erected from designs by Mr. John Nisbet, of Glasgow. The building is of fire-resisting materials throughout, all floors and roofs having been constructed by the Albion Fireproof Construction Co. This building is the first of its kind to be erected in Glasgow.

Caledonian Chambers, Union Street.

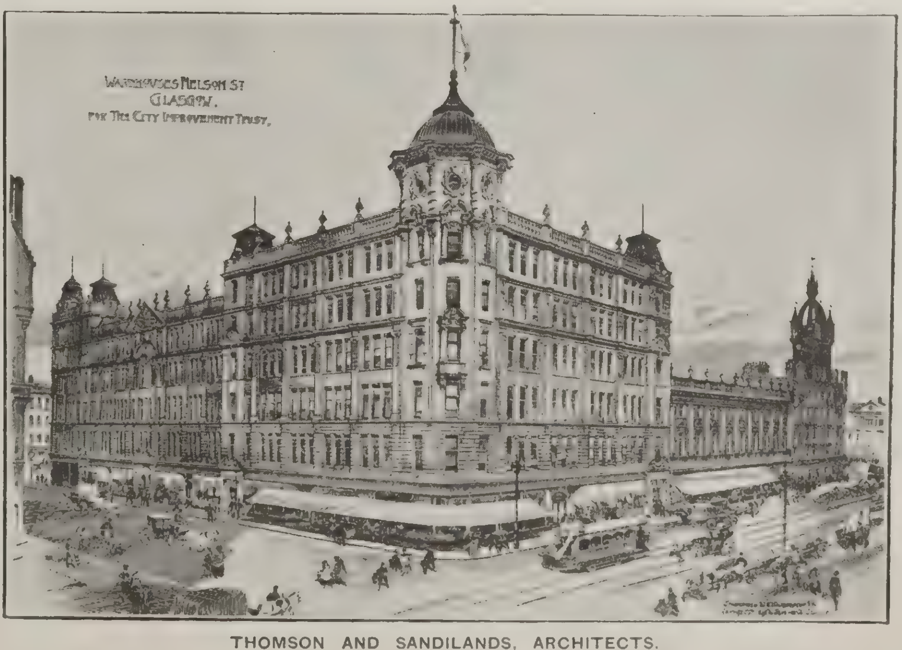
In Union Street a large block of shops and offices has been erected from designs by Mr. James Miller. The frontage is 184ft., and as the building is a high one and carried out in white freestone it is a very prominent addition to the thoroughfare. A balcony stretches across the front at third-floor level, and above, between the windows, a series of columns rises to the cornice. At either end of the building is a large broken pediment, supported on coupled columns carried by figures below acting as corbels. Two bay windows are arranged between the coupled columns, and over them is a shield with the Royal arms of Scotland thereon. At the northern end is an entrance to the Caledonian Railway station, with tea-room adjoining.

The contractors were Messrs. P. & W. Anderson, the principal sub-contractors being as follows (of Glasgow, except where otherwise stated) :—

Joiner work, John Cochrane; *plumbing*, Wm. Anderson; *plastering*, McGilvray & Ferris; *painting*, John Orr & Sons; *heating and ventilating*, Ashwell & Nesbit, Ltd., Leicester.

At the corner of Albion Street and Nelson Street a large block of shop premises has been erected from designs by Messrs. Thomson & Sandilands. This forms part of an improvement scheme, Nelson Street having been widened at this point from 25ft. to 50ft. and straightened. On the Albion Street front there are two good doorways. A photograph of one of them is given on page 265.

In Sauchiehall Street a new building has been erected for Mr. James Simpson. It



WAREHOUSES NELSON ST
GLASGOW.
FOR THE CITY IMPROVEMENT TRUST.

THOMSON AND SANDILANDS, ARCHITECTS.

is used as a furniture warehouse. There are two electric lifts within the building, the back one being for goods, and the passenger lift in the well of the main staircase. The building is built of Corrie stone from the Island of Arran. Messrs. Honeyman, Keppie & Mackintosh, of Glasgow, were the architects.

At the corner of George Square and Queen Street is a very large office block, with shops on the ground floor. The building is of white freestone, and by reason of its size and prominent position at once attracts attention. The main front is to Queen Street, and this is very successful, the entrance doorway, carried up to the second floor, forming a dignified feature. At fourth-floor level a balcony extends across the front, with a range of columns above, crowned by a heavy cornice. On the George Square front a similar treatment is followed, but the two arched openings at the top of the building, with railings across them, are unfortunate (see page 261). It would have been a great improvement if these openings had been omitted and the top cornice of the building kept to the same level as in Queen Street. The building has a flat roof, and is of fire-resisting construction throughout, the floors being subdivided by light fire-resisting partitions.

The following is the list of contractors (of Glasgow, except where otherwise stated) :—

Mason work, Thaw & Campbell; *steelwork*, P. & W. MacLellan, Ltd.; *joiner work*, John Baxter & Sons; *plumbing*, Wm. Anderson; *plastering*, D. & J. MacKenzie; *painting*, C. Carlton & Sons; *glazing*, C. & J. Malloch; *tiling*, Haddow, Forbes & Co.; *electric lighting*, Matthew Clerk & Co.; *heating and ventilating*, James Boyd & Sons, Paisley.

Anchor Line Building.

In St. Vincent Place, opposite the Scottish Provident Institution building, a large new block of offices for the Anchor Line Steamship Co. is in course of erection. At the present moment the work is at first-floor level. The particular interest of this building lies in the fact that the front and sides are to be faced with Doulton's "Carrara" ware. This is the first instance of the use of such material in Glasgow. It has already been pointed out how severely the Glasgow atmosphere attacks stonework; hence a material like Carrara seems admirably adapted to buildings in this city, as it can be treated architecturally and its glazed surface can be cleaned down with water periodically, as done, for example, at the Savoy Hotel extension in London. This new building of the Anchor Line Steamship Co. is to be seven storeys high. The ground floor and basement will be devoted to large booking offices in connection with passenger and freight departments; the first floor will be occupied by offices and private rooms of the company; while the floors above will be let as general offices. Mr. James Miller is the architect.

The principal contractors (all of Glasgow) are :—

Mason work, Thaw & Campbell; *steelwork*, P. & W. MacLellan; *joiner work*, G. Ferguson & Sons; *plumbing*, Wallace & Connell; *plastering*, McGilvray & Ferris; *glazing*, C. & J. Malloch; *tiling*, Galbraith & Winton.

New Buildings at the University.

To Sir Gilbert Scott's main block of Glasgow University many additions have been made at one time and another. Mr. John Oldrid Scott, F.S.A., with Mr. J. J. Burnet, are responsible for new engineering and anatomical laboratories to the east, and Mr. J. J. Burnet for the surgical laboratory and for the temporary accommodation for the chemical department immediately to the south of these. Mr. James Miller is the architect of the buildings now in course of completion to the west. One of the new buildings contains departments of psychology, materia medica, forensic medicine and public health, while the other contains the natural philosophy department. The cost of these new buildings is likely to amount to £100,000, including fittings and equipment.

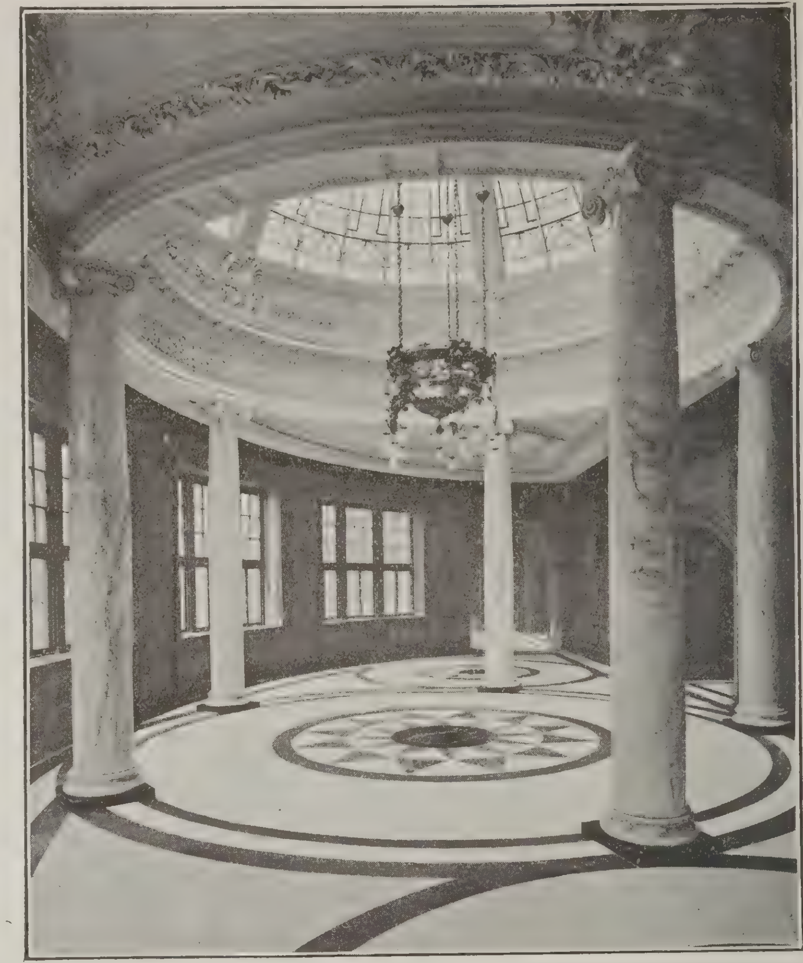


Photo: *Bedford Lemere & Co.*

CENTRAL STATION HOTEL EXTENSION: THE LOUNGE.
JAMES MILLER, A.R.S.A., F.R.I.B.A., ARCHITECT.

Central Station Hotel Extension

At the Central Station Hotel a large extension is being completed, providing a dining-room 100ft. by 50ft. by 30ft. high, with subsidiary dining-room, lounge, and billiard-room, together with about 130 bedrooms and sitting-rooms (the bedrooms being arranged with bathrooms *en suite*). The large new dining-room is not yet finished, but it promises to be a very fine apartment, with its richly-modelled plaster ceiling, marble columns, and walnut panelling 14ft. high. The lounge is most conveniently arranged, and the device of a domed light carried on marble columns, with a handsome electrolier in the centre, is well conceived. On the exterior to Hope Street the new work adds 150ft. to the frontage, and is in conformity with the main building, which was designed by Sir Rowand Anderson. The new frontage is carried out in white freestone from Giffnock quarries. Mr. James Miller is the architect.

The contractors are Messrs. P. & W. Anderson, the sub-contractors being as follows (of Glasgow, except where otherwise stated) :—

Joiner work, John Cochrane; *plumbing*, Wm. Anderson; *plastering*, McGilvray & Ferris; *painting*, Charles Carlton & Son; "*Atmospheric*" *heating and ventilating*, Ashwell & Nesbit, Ltd., Leicester; *electric fittings*, J. W. Singer & Sons, Frome; *dining-room finishings*, Wylie & Lochhead; *wood carving*, H. H. Martyn & Co., Cheltenham; *lounge and billiard-room ceiling*, Bromsgrove Guild, Bromsgrove; *dining-room ceiling*, George Jackson & Sons, London.

While referring to the extensions at the Central Station Hotel, it is opportune to mention the great enlargement being made to the station itself. The generous circulating space at this terminus of the West Coast Route (which provides such a splendid service of dining-car and sleeping saloon expresses between Euston and Glasgow, bringing the northern city within eight hours of London) is notable. Indeed, this terminus is excellently appointed throughout, not the least in respect of its underground lavatory. This is probably the largest of its kind in the Kingdom. It extends from the east side to the west side of the station, and is carried out in the best possible manner, there being, in addition to the usual conveniences, a long range of basins fitted with hot and cold water, as well as bathrooms and hairdressing and bootblacking rooms. For the sanitary fittings Messrs. Doulton & Co., Ltd., Messrs. Shanks & Co., Ltd., and Messrs. Twyfords, Ltd., were responsible, their work being a model of excellence; while the ventilation and heating was efficiently carried out by Messrs. James Boyd & Sons, of Paisley.

Correspondence.

Cutting Moulds for Flat Arch.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—While thanking "G. R. B." for his reply to my letter on the above, I maintain that the method he shows for the projection of the joint moulds is entirely wrong. He says in his letter that the height of the joint mould, No. 2, Fig. 4, is equal to the length of the line F′ G′ in the elevation, and that I am not correct in stating that the height of this joint mould should be equal to the length of the line *fg.*, Fig. 3. Now, the dotted line F′ G′, Fig. 2, being the approximate elevation of a helical joint, the development of that joint (*fg.*, Fig. 3) must be longer than its elevation. Therefore, the development of the line being longer than its elevation, it is obvious that the joint mould as drawn will be short, because the long edges of the joint moulds must (if properly projected) be exactly equal in length to the lengths of the joint arrises to which they refer and not to the lengths of the elevation of these joint arrises: thus, the *exact length* of this helical joint on the convex side of the wall and its corresponding edge on the joint mould is shown by the development to be *fg.*, Fig 3.

If the joint moulds had been projected on to a line parallel to *ml.*, Fig. 3, instead of the line parallel to M′ L′, Fig. 2, then the height of the resulting moulds would have been an approximation.

I might add that the development of the arris of the joint F.G. on the concave side of the wall will be shorter than the development of the same joint (*fg.*) on the convex side. Here again it is evident that the lengths of the long edges of the joint moulds in Fig. 4 are wrong.

The fallacy of "G. R. B.'s" method of projection will be clearly seen from the accompanying sketch, in which the angle of the joint to the horizontal has been exaggerated.—Yours truly,

GLASGOW. J. S. B.

Barnsley High School for Girls.

The extended time for sending in drawings expires on Friday, November 30th. The assessor is Mr. E. R. Robson, of Westminster.

Assessors.

Mr. Collcutt is to be complimented upon his frank avowal—in his presidential address—of his disbelief in the efficacy of a jury of assessors, and his conviction that one assessor—acting alone or with the aid of assistants—is the only possible means of obtaining a reasonable award, not so much for the logic of his deductions as for the eminent opinion which provides food for thought and matter for discussion. The President's pessimism is the result of the Peace Palace competition, in which he formed one of an international jury of assessors who acted the farce of selecting a design which could not be executed under double the stipulated amount, and then recommended, practically, that the design was worthless. The British representative was not party to the selection. Recently the architects of Holland have lodged a protest against the erection of the selected design; the fiasco will, no doubt, be rendered complete by a building dissimilar in every respect to the successful competitor's original conception. The Hague Peace Palace Competition was a failure, but the subject and circumstances were of an unusual kind, and the assessors were of different nationalities with each his prejudices. The marvel is that any agreement of opinion was arrived at, at all. Does it follow that every competition with more than one assessor must be a failure? At this juncture the London County Hall Competition proves particularly interesting, for there are to be three assessors, and until these gentlemen have proved their metal, it would be, perhaps, wise to reserve an opinion. Mention of the County Hall Competition brings a reminder that one of the assessors is to be chosen by the competitors. This appears to be the best possible way of selecting an assessor and one far in advance of any of the methods now in vogue. The delegation, to an individual, of the power to nominate assessors is fraught with more than one objection, notably—individuals do not possess equally sound judgment, and individualism provokes place-seeking and time-serving in others where independence and freedom of opinion are most necessary. The adoption of a system of selection by competitors would have to be accompanied by a variation of method, especially as regards the drawing up of the conditions. The most approved present course is for the assessor to be appointed early to advise upon the scheme and draw up the conditions. This preliminary expert advice would be still necessary and could be rendered separately and apart from the ultimate judging. The competitors' nominations for the assessor would be sent in with their designs, thus confining the selection to bona fide competitors. As the original adviser might make a desirable assessor his name could be put forward by the promoters as their nominee. To obviate the delay of ascertaining whether the person selected would be willing to act, a roll might be kept at the R.I.B.A. of the names and qualifications of architects desirous of undertaking the duties of assessors, whether members of the Institute or otherwise, and copies of the list could be available for a moderate fee. A little consideration will show that scale charges would then have to be adopted for the separate duties of preliminary advice and drawing up conditions and for assessing, the latter to be governed by the estimated value of the proposed work and the number of designs submitted. Space will not permit of more than the above outline of a system, which, if generally adopted, would go far towards obviating most of the evils attending present systems, by substituting for a privileged class of assessors a body of candidates from which selection could be made by the persons most concerned. The efficiency of the latter body could be promoted by the immediate removal from the roll, upon the representation of the competitors, of the name of any assessor who proved himself incompetent. The adoption of scale charges might be opposed by the members of what has been described as the privileged class upon the contention that expert services are worthy of special fees. The answer would be that scale charges apply in ordinary practice and that the biggest commissions fall, with few exceptions, to the most competent.

Labourers' Cottages, Dublin.

The following is a summary of the conditions of this competition :—

A competitor may submit alternative designs not exceeding three in number, which will all become the property of the Board if a premium is awarded for any one of them. All other designs will be returned.

The premium may be withheld if, in the opinion of the Board, none of the designs are suitable.

The award of a premium will not confer any right on the successful competitor to any further remuneration or employment in connection with any cottages built in accordance therewith.

Cost of erection of cottage with simple outoffices (such as open shed and pail closet) is not to exceed £130.

External walls less than 10ins. thick will not be considered suitable unless plastered with cement.

Four apartments are to be provided in all—three bedrooms and a kitchen or living room.

The site is to be taken as level, the height of the ground floor at 9ins. over ground level, and the full depth of foundations at 18ins. under ground level.

The clear height of rooms on ground floor to be at least 8ft., and of any room partly in the roof at least 8ft. for one-half of its area and not less than 4ft. at the walls.

The contents of kitchen or living room is not to be less than 1,200 cu. ft.; one bedroom must contain at least 900 cu. ft., and no bedroom is to be smaller than 600 cu. ft. In each bedroom a suitable position for a bed, 6½ft. by 4ft., is to be indicated by dotted lines.

Each room is to have window openings with an area of at least one-twelfth the floor area. It is desirable that each apartment should have a fireplace, and that not more than one bedroom should be entered through another, and very careful attention is to be given to means for easy ventilation of all rooms by the windows and otherwise.

All designs are to be prepared in the form of full working drawings to the scale of 8ft. to an inch, with all principal dimensions clearly figured thereon, and one sheet of details to the scale of 2ft. to an inch.

A plan of each floor, at least 2 sections and 3 elevations are required.

For each design the author is to furnish on a special form an estimate and a specification.

Obituary

Mr. Charles Locke Eastlake, for many years Keeper and Secretary of the National Gallery, died last week, aged about 70. After leaving school he was trained as an architect in the office of the late Mr. Philip Hardwick, R.A., won a medal in the Academy Schools, and travelled for three years on the Continent sketching architecture in France, Italy, and Germany. In 1866 he became secretary of the Royal Institute of British Architects. He was appointed to the National Gallery by Lord Beaconsfield in 1878 and held the post for 20 years. He retired in 1898.

Reinforced Concrete.— The Patent Indented Steel Bar Company's system of steel reinforcement is being used for the whole of the floors of the Waldorf Hotel in Aldwych, and also for the foundations and the floors of the printing machinery department of the new "Morning Post" building. Amongst other important contracts, this company is supplying the steel reinforcement for the new dock works now in course of construction in Scotland by the Coventry Ordnance Co.

Views and Reviews.

Suburban Houses.

Recently there has been no lack in the issue of books on small houses. Usually, however, they have been compilations of designs by various architects, the illustrations, moreover, being small, and, not infrequently, without plans. This is not the case with the book before us. It represents the work of Mr. Quennell only, and the illustrations are fine large collotypes, excellently printed, with plans on a generous scale. The houses shown are mostly on an estate which has been developed at Hampstead. The author says in his preface that the book represents "work done with a certain amount of success from the business point of view, and it is hoped that it will be more convincing than a series of suggestions or designs which have not been carried out. All the houses illustrated have been built on regulation building plots of varying width; they have been built for sale—and they have all been sold." With that clear definition, therefore, we must not expect to find in the book any clever excursions in house design, which, however interesting to architects able to appreciate them, would undoubtedly be tabooed by the general public—and the houses "have been built for sale." They are, nevertheless, good, straightforward examples, and the book being a record of work actually carried out, we have no doubt it will attract considerable interest.

"Modern Suburban Houses," by C. H. B. Quennell. London: B. T. Batsford, price 16/- nett.

Serial Publications on Construction.

In our issue of October 3rd we published a review of the first parts of three publications interesting to building students which are being issued serially by Messrs. Cassell & Co. One of these is Prof. Adams's "Building Construction," which was issued in this serial form before and is also to be obtained in volume form, in which latter we have reviewed it. It is an excellent treatise on many points that are not to be found dealt with in other books on building construction, but is, of course (as Prof. Adams claims for it), only a supplementary work to the recognised books on building construction. Being so well done, we only regret that Prof. Adams did not go further and deal with the whole subject, as we feel that he could have very much improved on the methods of some other authors, avoiding, at the same time, the objection of having to refer to two or more works for a complete treatment of the subject. The issue of the book serially is an excellent thing for students. It is well produced and many of the parts contain coloured plates, so that the price of it is very low.

As regards Cassell's "Carpentry and Joinery," Parts 2—8 certainly bear out the promise contained in the first part. The treatment of the subject is thoroughly practical and many illustrations are included which have been well and clearly drawn, so as to provide information as regards methods of framing parts of construction that are too often slurred over in other books on the subject. The perspective and isometric drawings are excellent in this way, and for the first time, so far as we know, this method of illustrating the subject is being thoroughly worked out in all the various parts of construction. From these the student is able to obtain in a few minutes an idea of the way in which the work is done practically, which can never be so clearly shown by elevations, plans and sectional drawings. Thus, in Part 3, there is an isometric drawing of the method of supporting joists round a brickwork fender in a basement; in Part 4 views of a double floor and framing around a chimney-breast; in Part 6 isometric views of king-post, queen-post and Mansard roofs and the apse-end of a collar-beam truss roof to a church; in Part 7 the inside of a plank truss roof; and in Part 8 the framing of dormer windows. Many points in the practice of carpentry and joinery are explained, which it is customary to record but not to give the reason why such should be done. We might refer, for instance, to the explanation of why herringbone strutting is superior to solid strutting.

As regards the third work to which we referred—namely, Prof. Adams's "Engineers' Handbook," we confess that the succeeding parts have been rather disappointing—not because they do not provide an immense amount of information in a most concise and intelligible form, but, up to the present, no illustrations have been included, and many of the explanations would be much improved in clearness by having small illustrative diagrams. Of course, the book is not a treatise, but only a collection of memoranda which it is presumed the reader has already studied theoretically in other books, in the classroom or in practice. The mass of data here collected covers such a wide field that we doubt if more than an exceedingly small number of engineers have a sufficient all-round knowledge to grasp the summarised information easily. No doubt specialists in each branch will be able to understand Prof. Adams readily, but a book like this is used by engineers of all kinds and referred to on points in branches of engineering with which the specialist is not intimately concerned. Consequently, such a book of memoranda should make it easy for the reader to obtain an adequate grasp of the subject in the shortest possible way, and illustrations undoubtedly not only convey information much more quickly, but enable the subject to be realised in a manner which pages of description would not do. As showing the style in which we should have liked to have seen the book illustrated, we might cite that well-known German handbook, "Das Ingenieurs Taschenbuch."

"Building Construction," by Prof. Henry Adams. Parts 2—8.

"Carpentry and Joinery," edited by Paul N. Hasluck. Parts 2—8.

"Engineers' Handbook, comprising Facts and Formulæ, Principles and Practice," by Prof. Henry Adams, M.Inst.C.E., M.I.Mech.E. Parts 2—8.

(Each published in 24 weekly parts, price 3d. each nett.) London: Cassell & Co., Ltd.

A Glossary of Architecture.

This small glossary is useful. It is very suggestive of Parker's "Glossary," but is more recent and contains a good deal more information. We hardly see the necessity, however, for the constant references to the author's indebtedness to his father for suggestions and information. The book, too, is dedicated to his mother. Evidently it is a family affair. On the whole, however, the book well merits a place in the architect's library.

"A Glossary of English Architecture," by Thomas Dinham Atkinson. London: Methuen & Co., price 3s. 6d. nett.

New London Buildings

At yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:

Re-erection of St. Michael's Hall, Ullin Street, Bromley, on the application of J. E. K. and J. P. Cutts, on behalf of the Rev. G. R. P. Preston. (*Consent.*)

Buildings on the site of Nos. 166 to 174, Acre Lane, Brixton, on the application of F. J. Eedle and Meyers, on behalf of A. T. Janes. (*Consent.*)

Projecting pilaster in front of No. 93, Great Tower Street, City, on the application of Lyne & Son, on behalf of Manfield & Sons. (*Consent.*)

Bay windows to three houses on the southern side of Upper Richmond Road, Putney, in connection with the application of E. J. Partridge. (*Consent.*)

One-storey shop in front of No. 399, Battersea Park Road, Battersea, to abut also upon Culvert Road, on the application of J. A. J. Woodward & Sons, on behalf of E. H. Disney. (*Refusal.*)

Water closets and the retention of a forecourt fence wall at the Kingsland Secondary School for Girls, Colvestone Crescent, Hackney, at less than the prescribed distance from the centre of the roadway of Birkbeck Road, on the application of T. J. Bailey, on behalf of the Education Committee of the Council. (*Consent.*)

Retention of a one-storey addition at the rear of No. 231, High Road, Lee, on the application of A. Young, on behalf of the Improvements Committee of the Council, with a boundary fence at less than the prescribed distance from the centre of the roadway of Turner Road. (*Consent.*)

One-storey shop in front of No. 1, Hamilton Road, Highbury, on the application of H. A. Geyer & Co. (*Refusal.*)

Buildings on the western side of Allfarthing Lane, Wandsworth, southward of St. Ann's Hill, to the line and with irregular open spaces at the rear of certain of the buildings, on the application of J. C. Radford, on behalf of C. S. Merrett. (*Consent.*)

Conversion of premises on the north-eastern side of Shrubbery Lane, Wandsworth, eastward of No. 99, Streatham High Road, into shops and dwelling-houses, also a modification so far as relates to the open space at the rear of the said premises, as proposed to be altered, on the application of E. L. Schneider, on behalf of W. Wallis. (*Consent.*)

Re-erection of stabling with a working-class dwelling over upon a site approached from the southern side of Gayford Road, Hammersmith, on the application of J. J. Kelf, on behalf of D. Blackwell. (*Consent.*)

Additions to the Bolingbroke Hospital, Bolingbroke Grove, Wandsworth Common, with portions of the administration block to exceed in height the width of Wakehurst Road, upon which it abuts, on the application of Young & Hall, on behalf of the Committee of the Hospital. (*Consent.*)

Formation or laying out of a street for carriage traffic to lead from Clay Lane to Ennis Road, Plumstead Common Road, so far as relates to an alteration in the position of the widening of Clay Lane southward of the said new street, on the application of J. O. Cook. (*Consent.*)

The Theatre and Music Hall Committee also reported the following:—

Drawing submitted by the Charing Cross, West End and City Electricity Supply Company, Ltd., showing a proposal to fix electric heaters at the Comedy Theatre, Panton Street, also drawings showing a proposal to fix six additional heaters in the stalls and pit. (*Consent.*)

Drawing submitted by W. G. R. Sprague showing the provision of an additional floor to the dressing-room block at the new theatre in course of erection in Shaftesbury Avenue and Rupert Street. (*Consent.*)

Drawing submitted by W. G. R. Sprague showing an additional dressing-room to be constructed at the new theatre in course of erection in Shaftesbury Avenue and Wardour Street. (*Consent.*)

Drawing submitted by Blow and Billerey, showing the proposed reconstruction of the stage at the Playhouse, Northumberland Avenue. (*Consent.*)

Drawing submitted by J. S. Quilter & Son, showing the additions which are in course of erection at the rear of St. Luke's Parochial Hall, Ramsden Road, Balham. (*Consent.*)

Drawings submitted by G. H. Dyball with regard to the proposed isolation of the main electric switches, fuses, &c., fixed to the walls of the pit lavatory at the Tivoli Music Hall, Strand. (*Consent.*)

New Companies.

John Morgan & Son, builders, contractors, &c., Pendarren Street, Aberdare. Capital: 5,000.

A. M. Warne & Co., manufacturers of portable buildings, &c., Fountain Works, Romford. Capital: £2,500.

J. T. Tusting & Sons, dealers in bricks, tiles, and other building materials, 136, Tenison Road, Cambridge. Capital: £3,000.

O. A. Brown, to acquire a lease of certain limestone quarries and other premises at Mitcheldean and Abenhall. Glos., and the business known as the Wilderness Portland Cement Works carried on there, and to adopt an agreement with O. A. Brown. Capital: £35,000.

Notes and News

Bristol Society of Architects.— At the recent opening meeting a paper on "Public Buildings" was read by Mr. H. W. Wills, F.R.I.B.A., of London.

Blackfriars Bridge Widening.—This work will probably be commenced before the end of the year. It is expected to cost between £200,000 and £250,000.

A new Theatre at Aberdeen is being completed from designs by Messrs. Frank Matcham & Co. It will seat 2,500 persons, and has cost £35,000.

A new Drill Hall at Nottingham, for the Robin Hood Rifles, is proposed to be erected. A design has been prepared by Messrs. Brewill & Baily, architects, of Nottingham.

The Great Wheel at Earl's Court.—Messrs. George Cohen, Sons & Co., of 600, Commercial Road, E., write pointing out that they have purchased and are taking down the great wheel at Earl's Court, not Mr. Walter Basset.

The Council Gold Medal of the Surveyors' Institution has been awarded to Mr. W. R. Baldwin-Wiseman, M.Sc., F.G.S., A.M.I.C.E., for his paper on "The Effect of Fire on Building Stones," read at the meeting of the Institution in May last.

Church House, St. Clement's Parish, Hastings, was opened last week by the Bishop of Chichester. The architects were Messrs. Cooper & Coussens, A.R.I.B.A., of Hastings, and the builder was Mr. W. F. Ditch, of Hastings. The cost of the building has been about £1,570.

A new Chapel at Plymouth for the Primitive Methodists is being erected by Messrs. A. R. Lethbridge & Son, from designs by Mr. H. J. Snell and Messrs. Thorneby & Rooke, of Plymouth, joint architects. The chapel occupies a site at the junction of Cobourg Street and York Street, and is estimated to cost £9,000.

The Tower of the Parish Church of Peterstone, near Marshfield, Mon., is to be restored under the direction of Mr. Dashwood Caple, of Cardiff, Architect and Diocesan Surveyor for Monmouthshire. Every care is to be taken to avoid disturbing the old work more than is absolutely necessary. The church is said to be one of the finest in the county. The tower, however, is much in need of repair; last summer one of the pinnacles fell down.—At Llanishen Church, Mon., the tower, which was struck by lightning about a year ago, has been rebuilt under Mr. Caple's direction.

The David Lewis Club, Liverpool, in connection with the hostel in George George Place, was opened recently. The club is intended for the benefit of the hard-working poor of Liverpool, in addition to those residing in the hostel, and includes a theatre capable of accommodating about 1,000 people. The architect was Mr. J. Francis Doyle, and the builder Mr. Isaac Dilworth, of Liverpool. The hostel was fully described and illustrated in The Builders' Journal for January 18th, 1905.

Leeds and Yorkshire Architectural Society:—In the course of his presidential address on Thursday last, Mr. H. S. Chorley, M.A., F.R.I.B.A., referred to the fire at Selby Abbey, which, he said, had demonstrated the danger of timber roofs, and raised the question whether it was possible to put fire-resisting vaulted roofs in Gothic churches. The stability of such buildings as the Pantheon and the Basilica of Constantine at Rome was due to the fact that their roofs were made of imperishable materials. Another question worthy of discussion was the preservation of our ancient monuments. Mr. Chorley urged that it was necessary that there should be a system of survey and cataloguing to obtain a complete knowledge of all the architectural treasures the country possessed. Full insurance against fire should be insisted upon in every case, and an inspector of ancient monuments should be appointed. The president also referred to the garden city movement and to registration; for the latter there was a growing necessity.

Books on Reinforced Concrete.— Messrs. Archibald Constable & Co. hope to publish as early as possible in the coming year a Pocket-Book on Reinforced Concrete and Steel Frame Construction, by Messrs. Charles F. Marsh and W. Dunn, joint authors of the 3rd edition of "Reinforced Concrete." The pocket-book will contain information on practical construction and design with diagrams and tables for the simplification of the work necessary for the calculations of the various structures dealt with. Examples will also be given showing the methods of working and the applications of the diagrams and tables. Such a book will be welcomed by all those interested in this form of construction, since it will contain in a condensed and handy form much useful information both for engineers and architects responsible for efficient design, and also for those engineers, builders, and overseers engaged on the practical work of construction. The new, 3rd and revised, edition of "Reinforced Concrete" by Mr. Charles F. Marsh will be issued in the course of a few weeks. In its preparation, in which no pains have been spared to bring the subject exhaustively up-to-date, Mr. Marsh has been associated with Mr. W. Dunn, F.R.I.B.A., as joint author.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Books on Sewerage, Sewage Disposal, etc.

Carlisle.—Beta writes: "Can you recommend good books on the following subjects:—(1) Sewerage (I have Col. Moore's 'Sanitary Engineering,' and Waring's 'Drainage.') (2) Hot-water service and heating. I want a book that gives the method of arriving at sizes of pipes, boiler and cylinder. (3) Sewage disposal. Do you consider Santo Crimp's book a good one? I have no knowledge of chemistry; is this necessary? (4) Pumping machinery. I want a book giving the outline of the subject to enable one to select the kind of pump for the given condition, the duty to specify, the information to give manufacturer, and to aid one in selecting the best design, not one that would be required by a maker. (5) Advanced applied mechanics. The books are required for a junior assistant in a civil engineer's office who is engaged on sewerage and water schemes for small towns and villages, and who has a knowledge of mathematics sufficient for the South Kensington Advanced examination."

(1) "Practical Sanitary Engineering": Francis Wood, 8s. 6d. (2) "Warming Buildings," by C. Hood and Frederick Dye, 15s., and "Heating by Hot Water, Ventilation and Hot Water Supply," by Walter Jones, 6s. 6d. (3) No; now out of date. You should have Dr. Rideal's book "Sewage and the Bacterial Purification of Sewage," 14s. This will give you all the chemical and bacteriological factors; and our "Municipal Engineers' Specification, No. 1" (3s. 3d. post free), which contains a good summary that you should master before reading up Rideal's work, as the subject is very intricate. An additional work that would be very useful is Mr. A. J. Martin's Summary of the Royal Commission Evidence, called "The Sewage Problem," 8s. 6d. (4) "British Progress in Pumps and Pumping Engines," Philip R. Björling, 6s. nett. (5) "Manual of Applied Mechanics," by Prof. W. J. M. Rankine, 12s. 6d.; "Applied Mechanics," by Prof. John Perry, 7s. 6d., and "Mechanics Applied to Engineering," by Prof. John Goodman, 8s. All these can be obtained from our offices, post free, at the prices given.

Liability for Paving and Curbing.

KEY writes: "I have some land with about 1,000ft. frontage on one side of a road—an old one repaired by the district council. On the oposite side houses have been built for more than 20 years. The road is not a 40-ft. road, but varies in width. I have built some villas on my side. Can the district council make me do the paving and curbing (the other side of the road has been done), or can I claim compensation for land given up?"

We do not think you can be forced to pay for this; but the ruling cases do not exactly cover the facts stated by you. The nearest is the case of *West Ham Corporation v. McDowall,* decided against the Corporation at West Ham Police Court, January 24th, 1894, and *White v. The Vestry of Fulham,* decided against authority on appeal from magistrates' decision to Queen's Bench Divisional Court, January 21st and April 18th, 1896 (before Justice Hawkins and Justice Vaughan Williams). You should take legal advice.

Kempe's Glass.

Referring to the enquiry under this head in last week's issue, Mr. Walter E. Tower, of London, W., writes:—"Mr. Bodley's fine church at Hoar Cross, Staffordshire, does not contain any work by Mr. Kempe; but, on the other hand, the Duke of Newcastle's church at Clumber has several windows. Your enquirer also should know of the large Church of St. Hilda at Whitby, which contains many windows of Mr. Kempe's, two of them very large. There is also a fine series of windows by the same hand at Sedbergh School Chapel, Yorks, and Wednesbury Parish Church should not be passed over. Several churches at Brighton show complete, or nearly complete, series, and a very fine example was lately erected in the great east window of the new chancel to St. Peter's. Mr. Bumpus does not do justice to as many as ten windows at Lichfield Cathedral, over and above those named in the chapter-house: these are in the nave, the south transept, and choir aisles; St. Chad's Chapel and two great windows of ancient glass in the Lady Chapel also show his efforts in this cathedral. At Gloucester Cathedral there are as many as five or six windows in the ambulatory of choir; and, again, in the south transept of Chester Cathedral may be noted four windows as a consecutive series."

Construction of Swimming-Bath.

CHORLEY WOOD.—C. R. writes: "Kindly inform me of a simple way to construct a swimming-bath. The question is entirely one of expense, as the work is to be carried out by a local club with subscriptions from local residents. The ordinary methods are well known to me, but the simplest and cheapest method must be adopted. The site is open, and on the banks of a stream. The soil is peat for 3ft. or 4ft., and under this lies a bed of ballast, through which the water rises as easily as through a sieve. It is necessary to excavate sufficiently to give a depth of water varying from 3ft. to 7ft., and the water level will be about 18ins. from the ground level. I wish to obviate the necessity of pumping, which would entail a large expense, and the only way I can suggest is to drive piles around the area to be excavated, and encase with sheet piling to the necessary depth. The question of flooring is the most difficult problem in these circumstances. It is, of course, desirable to have this of concrete if possible, but I cannot see my way to do this. I can only suggest a flooring of loose sand, which would be least harmful to the feet, and could be easily deposited. Can you suggest anything better, or any simpler mode of construction?"

We think the best thing you can do is to drive interlocking steel sheet piling on the method largely used in the United States and recently introduced into this country by The British Steel Piling Co., of Dock House, Billiter Street, E.C. This sheet piling could be left in permanently, or if you can spare the expense a concrete retaining wall could be constructed inside and the steel piling then withdrawn. You ought to adopt a concrete bottom, and covered with tiles. This would get slimy unless cleaned. On the other hand, the sand which you propose would not prevent the loam working up, and would get dirty. We think that you might compromise by laying concrete paving slabs on the bottom and putting sand on these. The sand could then be renewed occasionally.

Rubber Flooring.

GLASGOW.—LIBRARIAN writes: "Please give names and addresses of firms who supply india-rubber flooring."

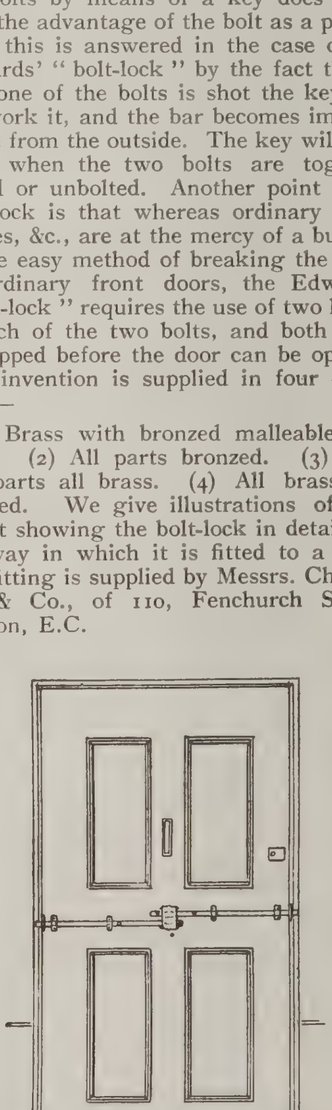
Messrs. A. L. Gibson & Co., 19, 20 & 21, Tower Street, Upper St. Martin's Lane, W.C.

Trade and Craft.

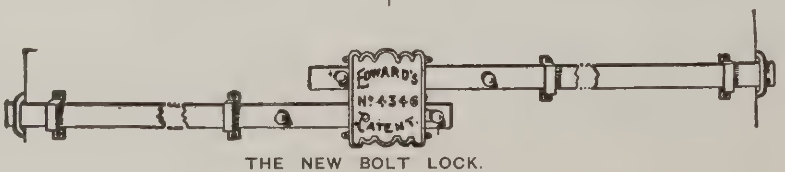
An Ironmongery Novelty.

Our method of securing entrance doors by means of bolts is effective but crude. When the bolts are shot it is usually quite impossible to unbolt them from the outside. This, of course, in one way is an advantage, but there are disadvantages. A new patent bolt, which is at the same time a lock, in so far that it can be opened from the outside by means of a key, has just been placed on the market which seems to effectually solve the problems involved. Householders who are nervous of leaving the front door unbolted and yet must do so because members of the family will arrive home late, can, by fitting this "bolt-lock," bolt the door before retiring for the night and still leave it possible for the late comers to unbolt it from the outside by means of their key. The point will, of course, be raised that the fact that it is possible to unlock the bolts by means of a key does away with the advantage of the bolt as a protection; this is answered in the case of the Edwards' "bolt-lock" by the fact that if only one of the bolts is shot the key will not work it, and the bar becomes impenetrable from the outside. The key will only work when the two bolts are together bolted or unbolted. Another point about this lock is that whereas ordinary bolts, latches, &c., are at the mercy of a burglar by the easy method of breaking the glass of ordinary front doors, the Edwards' "bolt-lock" requires the use of two hands to each of the two bolts, and both must be slipped before the door can be opened. This invention is supplied in four qualities:—

(1) Brass with bronzed malleable iron bolts. (2) All parts bronzed. (3) Bolts and parts all brass. (4) All brass, all bronzed. We give illustrations of this patent showing the bolt-lock in detail and the way in which it is fitted to a door. The fitting is supplied by Messrs. Chittenden & Co., of 110, Fenchurch Street, London, E.C.



BACK OF DOOR, SHOWING BOLT FIXED.



THE NEW BOLT LOCK.

Complete List of Contracts Open.

With a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Nov. 28. Belfast.—*Alterations to Peter's Hill Baths*, for the Baths and Lodging House Committee. Drawings and specification may be seen, form of tender obtained, and bill of quantities received on payment of £1 1s., in City Surveyor's office. Sealed tenders, endorsed "Alterations to Peter's Hill Baths," to be lodged with S. Black, town clerk, before 10 a.m. on Nov. 28.

Nov. 29. Belfast.—*Erection and completion of a warehouse* in Curtis Street, Belfast, for Messrs. The Central Furnishing Company. The drawings and specification and conditions of contract, with further particulars, may be seen with T. W. Henry, architect, Ocean Buildings, Belfast, between the hours of 10 and 5. Tenders, endorsed, to be lodged with him not later than Nov. 29, at 12.

Nov. 29. Beaminster.—*No. 1, Building of new bath-room* and W.C.; No. 2, erection of new piggeries, for the Guardians of the Beaminster Union. Plans and specifications can be seen of R. Leigh, clerk to the Guardians, Beaminster, from 10 a.m. to 4 p.m. any week-day (Saturdays excepted). Tenders (separate for each work) to reach him by 9 a.m., or be delivered at the Union House, Stoke Abbott, before 11 a.m. on Nov. 29.

Nov. 29. Scarborough.—*Construction of boundary walling*, &c., at the Central Council Schools playground, Columbus Ravine, Scarborough. Plans and specifications may be seen, and form of tender and bills of quantities obtained on application to H. W. Smith, A.M.I.C.E., borough engineer and surveyor, Town Hall, Scarborough. Sealed tenders, endorsed "Tender for Boundary Walling, Central Council Schools," in an envelope provided for the purpose, to be delivered at the office of D. A. Nicholl, town clerk, not later than 12 noon on Nov. 29. A deposit of £1 1s. is to be made with the Borough Accountant before any particulars or form of tender can be supplied.

Nov. 30. Mansfield.—*Erection and completion of additional buildings* in connection with Tin Works, Rock Valley, Mansfield, for Messrs. Barringer, Wallis & Manners, Ltd. Applications to be sent in to Vallance & Westwick, architects, Mansfield, not later than Nov. 30. Bills of quantities will be supplied on payment of £2 2s.

Nov. 30. Ashford.—*Widening of the bridge* over the ditch, Beaver Road, near the Sewage Pumping Station, for the U.D.C., in accordance with the plan and specification, which may be seen on application to W. Terrill, surveyor, North Street, Ashford, Kent. Sealed tenders, endorsed "Bridge Widening," to be sent to J. Creery, solicitor, clerk, 11, Bank Street, not later than 5 p.m. on Nov. 30.

Nov. 30. Ystrad Mynach.—*Erection of a proposed hotel* at Ystrad Mynach for Messrs. D. Williams & Co., Taff Vale Brewery, Merthyr Tydfil. Plans, specifications, and bills of quantities may be seen at the above address, or at the office of R. Edwards, architect and surveyor, Brynheulog, Treharris. Builders desiring to tender must send in their names to the architect, together with a deposit of £2 2s., when bills of quantities, form of tender, and particulars will be forwarded. Sealed tenders to be sent to W. Griffiths, D. Williams & Co., Taff Vale Brewery, Merthyr Tydfil, endorsed "Tender for Erection of Half-way House Hotel," on or before Nov. 30.

Sealed tenders, endorsed "Tender for Bishop Middleham Sewerage," must be sent to J. W. Lodge, clerk, Union Offices, Sedgefield, Ferryhill, not later than 10 a.m. on Dec. 21.

Jan. 7. Stourport.—*Provision, laying and jointing* of cast-iron and stoneware pipe sewers, together with manholes, lampholes and flushing chambers, the construction of task sewer, engine-house, liquefying tanks, distributing carriers, effluent drains, and other incidental works, in accordance with the drawings and specification prepared by the engineers. Drawings and specification may be seen and bills of quantities obtained at the offices of Wilcox & Raikes, engineers, 63, Temple Row, Birmingham, on payment of a deposit of £5 5s. Sealed tenders, in the envelopes supplied, endorsed "Stourport Sewerage—Contract No. 1," to be delivered to C. H. Watson, clerk to the Council, Stourport, not later than 12 o'clock noon on Jan. 7.

No date. London, S.W.—*Reconstruction of drainage* at Kingston Brigade Depôt in the Eastern Command. The plans, specifications, and condition of contract may be inspected at the office of H. B. Measures, F.R.I.B.A., director of barrack construction, War Office, Atterbury Street, Grosvenor Road, S.W., on Nov. 26, 27 and 28, and bills of quantities and form of tender obtained on those days only, on payment of the sum of 10s. (not returnable).

MISCELLANEOUS.

Dec. 3. Sunderland.—*Supply of iron, castings,* wire rope, oils, and other colliery stores, except timber, for the South Hetton Coal Co., Ltd. Forms of tender and specification, with full conditions, may be obtained from J. R. Lambert, South Hetton, Sunderland, and applicants for forms must state the kind of stores for which they wish to tender. Tenders, addressed to the South Hetton Coal Co., Ltd., South Hetton, Sunderland, will be received up to Dec. 3.

Dec. 3. Norwich.—*Supply of the following materials and work* during 1907.—Gravel, flints, &c., paving setts, materials for macadam roads, cement, ironware drainage pipes and fittings, stoneware ditto, British wood, foreign wood, iron, cast-iron manhole covers, gullies, &c., bricks, tar shingle for bottoms, footpath tar-paving and tar-macadam materials, engine fitter, boiler maker, and founder. The necessary specifications, forms of tender, &c., may be obtained of E. Collins, M.Inst.C.E., city engineer, &c., Guildhall, Norwich. Tenders, on the forms supplied, enclosed in envelopes sealed with sealing wax, endorsed "Tender for ——," and addressed to the Chairman of the General Purposes Committee, must be delivered at the City Engineer's office not later than 10 a.m. on Dec. 3.

TOO LATE FOR CLASSIFICATION.

Nov. 29. Heeley.—*Erection of additions* and alterations to the school and outbuildings in Cross Myrtle Road, Heeley, Sheffield. Builders wishing to tender are requested to send their names to A. F. Watson, F.R.I.B.A., architect, 38, Church Street, Sheffield, on or before Nov. 29. Fair wages clause. Tenders will only be received on printed forms and in covers supplied by the Architect.

Dec. 3. Matlock.—*Erection of a proposed new Boarding House,* to be built on land situate at Matlock Bank. Application should be made to D. M. Wildgoose, architect, Edge Road, Matlock, on or before Dec. 3, when, if name be accepted, bills of quantities will be supplied and date when tenders should be sent in.

Dec. 3. Tunbridge Wells.—*Painting and other work* in connection with the Town Hall premises for the Borough Council. Specification and all other particulars may be obtained at the offices of W. H. Maxwell, A.M.I.C.E., borough surveyor, Town Hall. Tenders are invited from persons residing in the Borough. The person or firm whose tender is accepted will be required to enter into a contract and bond with two approved sureties for the due performance of the contract. Tenders endorsed "Painting Work, Town Hall," to be sent to W. C. Cripps, town clerk, Town Hall, Tunbridge Wells, on or before Dec. 3, at 9 a.m.

Dec. 4. Coventry.—*Enclosing the Corridor leading* from the Nurses' Home to the New Infirmary for the Guardians of the Coventry Union. Plans and specification may be obtained upon application to T. F. Tickner, M.S.A., architect, High Street Chambers, Coventry. Tenders to be delivered at the Union Offices, 13, Little Park Street, not later than 3 p.m. on Dec. 4.

Dec. 4. Windsor.—*Making-up, &c., Beaumont Road,* for the T.C. Plan, specification, and general conditions may be seen, and forms of tender obtained upon application at the Borough Surveyor's Office, Alma Road, Windsor. Sealed tenders to be sent in to E. Cecil Durant, Town clerk, 3, Park Street, Windsor, on the form supplied, endorsed "Beaumont Road," not later than 5 p.m. on Dec. 4.

Dec. 5. Burntisland.—*Erection of a sea wall* on the west side of the Harbour and Cromwell's Dyke at Burntisland. Plans and specifications may be seen, and form of tender obtained at the office of John Isles, collector to the Burntisland Harbour Commissioners. Sealed tenders to be sent to the Burntisland Graving Dock Construction Syndicate, Ltd., 31, Lombard Street, London, E.C., marked "Sea Wall, Burntisland," on or before Dec. 5.

Dec. 6. Sheffield.—*Plumbers' and glaziers' work* required for general repairs during the year 1907, for the Education Committee. Specifications and forms of tender, together with cover for same, may be had on application at the Office of the Education Committee, Leopold Street, until Dec. 3, 1906, and sealed tenders, which will only be received on forms and in covers provided, should be sent to J. F. Moss, secretary, not later than Dec. 6.

Dec. 7. London, S.E.—*Supply and erection of wrought iron fencing* at Ruskin Park, Denmark Hill, S.E. Full particulars and information as to the conditions to be observed by tenderers are given in the "London County Council Gazette" of Nov. 26, 1906 (price 1d., or post free 1½d.), which can be obtained from P. S. King & Son, 2 and 4, Great Smith Street, Westminster, S.W. No tender will be received after 10 a.m. on Dec. 7.

Dec. 10. Hitchin.—*Erection of a new boiler shaft* at the Union Workhouse, Hitchin, for the Guardians. A plan and specification can be seen of A. E. Passingham, clerk, Union Offices, Old Town Hall, Hitchin. Sealed tenders, endorsed "Boiler Shaft," to be received by him not later than 10 a.m. on Dec. 10, and such tenders will be opened at a meeting of the Guardians on Dec. 11.

Dec. 10. Alnwick.—*Providing and laying a new main sewer* along the east side of Alnmouth, consisting of 82yds. of 12-in., 321yds. of 9-in., and 42yds. of 6-in. sanitary pipes and accessories, for the R.D.C. The plan, section, and specification may be seen upon application to H. W. Walton, clerk, Alnwick, to whom sealed tenders, endorsed "Alnmouth Sewer," are to be delivered before 1.30 p.m. on Dec. 10.

Dec. 12. Lochgelly.—*Proposed new branch premises,* Lochore, for the Lochgelly Equitable Co-operative Society, Ltd. Plans and specifications may be seen, and all further information obtained on application to J. T. Scobie, architect, Dunfermline and Lochgelly, and sealed tenders to be lodged with J. Mitchell, secretary, at the Society's Offices, on or before Dec. 12, by 5 p.m.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, E.C.*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

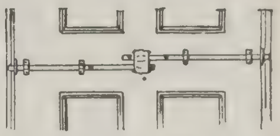
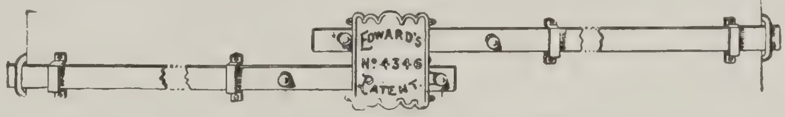
A Powerful Bolt for the Front Door that can be Locked from the Outside.



Burglars cannot force the door or obtain an entry by Picking the Lock or False Keys when this Lock is fitted.

It bolts on the inside, where either Bolt can be opened or locked by hand; from the outside by means of the key provided, which needs turning twice either to lock or unlock. The Bolt shoots into hasps inset in each door-post and cannot be forced. When only one Bolt is shot, and this is desirable when everybody has retired for the night, the Lock cannot in any way be opened from the outside.



Specially recommended for the **Front Doors of Flats, Houses, Offices, Store Rooms, etc., etc.** It is designed mainly to enable the **Bolting and Unbolting of a Door from the outside**, so necessary **where Houses, Flats, etc., are occasionally left unattended.** The Lock is made in four qualities, nicely finished, for any width of Door. Stocked for 36-in. Doors or narrower.

For full Particulars or to see Sample, write to

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

ARCHITECT'S ASSISTANT (Scotch); 14 years' good general experience; design working drawings, details, &c.; good references. Moderate salary. London preferred.—Box No. 2216, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S ASSISTANT (23) seeks ENGAGEMENT; working drawings, details, quantities, surveying, &c.; good draughtsman and excellent refs.—J. W. H., "Homeleigh," Ashgate Road, Chesterfield. 2215

ARCHITECT'S ASSISTANT (23) seeks RE-ENGAGEMENT; over 6 years' all-round experience; planning, quantities, surveys; neat draughtsman; excellent refs. Mod. sal. Student R.I.B.A.—Box 2211, BUILDERS' JOURNAL OFFICE, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT (29), wishing to purchase a practice, seeks a POSITION as ASSISTANT with view to superseding principal.—Box 2220, BUILDERS' 6, Great New Street, London, E.C.

ARCHITECT'S JUNIOR or IMPROVER (23), 5½ years' experience; plans; working drawings; details, colouring, &c.—WILLIAM BUCHANAN, Clifton, Motherwell, N.B. 2241

ARCHITECT & SURVEYOR'S ASSISTANT desires ENGAGEMENT; 6½ years' varied experience; London or Provinces; good refs. from London and country Architects. Salary 35s.—A.P., 46, Kenwyn Road, Clapham, S.W. 2203

ARCHITECT'S ASSISTANT requires SITUATION; 6½ years' country and London experience; good references, working drawings, details, etc., etc. Salary moderate.—Box 2187, BUILDERS' JOURNAL Office, 6, Great New Street, London, E.C.

ARCHITECT'S ASSISTANT desires SITUATION: served articles; good draughtsman; drawing from life; 5½ years' general exp.; good tests. and certs. Moderate salary.—Box 2206, BUILDERS' JOURNAL Office, 6, Great New Street, London, E.C.

ARCHITECT & SURVEYOR'S ASSISTANT (24), DISENGAGED; 7 years' all-round experience; abstainer; design prize-winner; moderate salary.—Box 2229, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, London, E.C.

ARCHITECT'S JUNIOR ASSISTANT (21); 4½ years' varied experience; assist with quantities; good references.—G. EWINGTON, 72, St. Ann's Hill, Wandsworth, S.W. 2228

ARCHITECT'S ASSISTANT (25) DISENGAGED. Nine years' experience; good draughtsman, designs, working drawings, details, etc.; London or country.—W. A. N., 46, St. Augustine's Road, Camden Square, N.W. 2233

ARCHITECT'S ASSISTANT (25) desires ENGAGEMENT. Working drawings, details, perspectives, quantities, &c. Good designer and colourist.—AUBREY PRITCHARD, The Grove, Rhyl, North Wales. 2232

ARCHITECT'S JUNIOR ASSISTANT desires RE-ENGAGEMENT in a good London office: 6 years' experience; good references; salary moderate.—B. E. ATKINSON, Junr., 14, Rosslyn Hill, Hampstead, N.W. 2245

ARCHITECT'S JUNIOR ASSISTANT requires ENGAGEMENT. Neat draughtsman, tracer, colourist, &c. Specimens submitted. When writing state salary offered.—Apply J.E.T., 24, Ashbourne Road, Mitcham, Surrey. 2227

ASSISTANT (27), 12 years' first-class experience; passed final R.I.B.A.; design working, drawings, details, perspectives, specifications, supervision, quantities and general office work; salary very mod.—B., 85, Durham Road, East Finchley. 2223

BRICKWORK WANTED by rod or job, by experienced man. Would take charge. Good refs.—Box 2195, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

BUILDER desires a SITUATION in any capacity; would take entire charge of an estate, large or small, in any district and execute repairs; building or alterations; finding all tools and plant; highest references.—LEWIS, 9, King's Parade, Isleworth. 2214

BUILDERS' MANAGER or FOREMAN, capable of interviewing clients, measuring, estimating, setting out, and general supervision of outside jobs: last situation 9 years (London). Carpenter by trade.—Box 2192, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

BUILDER'S ASSISTANT, age 33, seeks SITUATION; nineteen years' experience; well up in the various branches: first class references. —Address, Box 2208, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

CLERK of WORKS or GENERAL FOREMAN (Carpenter and Joiner), large and varied experience, practical in all branches, well up in plans, &c. Recently completed large industrial development as clerk of works; age 38.—Box 2246, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

CLERK OF WORKS desires ENGAGEMENT; past experiences: library, theatre, almshouses, factories, furnaces, steam boilers, heating, electric lighting, hydrants and sprinklers.—G. R., 17, Sweet Briar Walk, Upper Edmonton, N. 2213

CLERK of WORKS wants RE-ENGAGEMENT. Town or Country. Experienced and practical. First-class references from London and country architects.—F. B. S., 17, Southborough Road, South Hackney, London, N.E. 2242

CLERK OF WORKS wants RE-ENGAGEMENT; Town or Country; experienced and practical; excellent references and testimonials from Architects and Public Bodies.—T.H., 51, Bury Street, Lower Edmonton, N. 2191

CARPENTER, JOINER wants JOB. Bench, fixing or jobbing, or will take piecework any quantity; labour only; good testimonials.—H., 86, Alderney Street, Pimlico, S.W. 2225

CLERK OF WORKS; large and varied experience, thorough knowledge, labour, material and construction; leveller, draughtsman, and keen supervisor; at liberty.—J.M., 77, Welbourne Road, Tottenham. 2163

CLERK OF WORKS or GENERAL FOREMAN seeks RE-ENGAGEMENT, town, country or abroad; thoroughly experienced home and abroad; good testimonials; age 35.—P. G., 428, Uxbridge Road, W. 2224

ESTIMATOR'S ASSISTANT (22), DISENGAGED; quick and reliable at figures; abstracting and accounts; used to large works, also time, wages, and general routine; good references.—A., 100, Hamilton Road, Wimbledon. 2230

GENERAL FOREMAN; capacity reliability; references from all employers from apprenticeship, including present employer and seven years with last.—G. A. GREEN, 112, Fulbourne Road, Forest Road, Walthamstow. 2164

GENERAL WORKING FOREMAN seeks RE-ENGAGEMENT. Trade Carpenter and Joiner; age 33; abstainer; reliable; 6 years' good references.—A. C. SMITH, 86, Brunswick Road, Leyton. 2244

GENERAL OR WORKING FOREMAN (carpenter), new or alterations. o. management, good jobbing. Practical experience all branches, good manager of men; well-up in plans.—W., 29, Pollock Road, Walworth, S.E. 2205

GENERAL or WORKING FOREMAN DISENGAGED. In London or country. Twenty years' practical experience in new building and alterations. Trade, bricklayer. Age 43. Good references from last employers.—H.C., 5, Westbury Road, Paddington. 2226

IMPROVER to the Writing, Graining, Decorating, &c., wants SITUATION; age 21; just finished apprenticeship.—F. CLARKE, 112, Cox Street, Coventry. 2186

PAINTER (good) requires WORK; young man, age 27; town or country; used to all classes of work; abstainer; state wages.—A.W.P., 19, Chesterfield Gardens, Harringay, Middlesex. 2175

QUANTITY SURVEYOR'S ASSISTANT (22) desires ENGAGEMENT; 6 years' London experience working up and taking off; temporary or otherwise; London or Provinces; salary moderate.—Box 2165, BUILDERS' JOURNAL.

QUANTITY SURVEYOR'S ASSISTANT (21) desires ENGAGEMENT, temporary or permanent, working up and taking off. Excellent references.—Box W., BUILDER'S JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

TO BUILDERS.—Carcasing, Fixing Stairs, or Joinery WANTED, Piecework, Houses taken right out. Labour only.—G. BOWN, 27, Spruce Hill Road, Walthamstow. 2239

TO QUANTITY SURVEYORS.—Assistant (30); quick, reliable, good London experience, taking off, measuring-up, expert worker-up, &c. Temporary or permanent; terms moderate.—Box 2169, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

WORKING GENERAL FOREMAN seeks SITUATION; trade bricklayer; age 30; good references, abstainer.—Address M. G. C., 25, Jerrard Street, Lewisham, S.E. 2247

Appointments Vacant

COUNTY OF LONDON.

THE LONDON COUNTY COUNCIL invites applications for the post of DRAUGHTSMAN at the L.C.C. School of Building, Ferndale Road, Clapham, S.W. The commencing salary will be £65 a year, rising by annual increments of £5 to a maximum of £80 a year.

Applicants should be about 19 or 20 years of age, should possess a sound knowledge of Building Construction, and have had some office experience.

The successful candidate will be required to give his whole time to the duties of his office. Applications should be made on the official form to be obtained from the Clerk of the London County Council, Education Offices, Victoria Embankment, W.C., to whom they must be returned not later than 10 a.m. on Saturday, 8th December, 1906, accompanied by copies of three testimonials of recent date. Full particulars of the appointment are given in the "London County Council Gazette," of 3rd December, 1906, which can be obtained from Messrs. P. S. King & Son, 2 and 4 Great Smith Street, Westminster, S.W., price 1d., post free 1½d.

Canvassing for this post either directly or indirectly will be considered a disqualification.

G. L. GOMME,
Clerk of the London County Council.
Education Offices,
Victoria Embankment, W.C. 26th Nov., 1906.

ARCHITECT'S ASSISTANT WANTED (country); working drawings; details; surveying; assistance in quantities and supervision; state experience, age and salary.—Box 2243, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

WANTED.—Setter-out for Joiner's Rods in good class Builder's Shop. Chance for young man wishing to improve his position. State age and experience. Near King's Cross.—Box 2249, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

CLERKS OF WORKS WANTED immediately for Hennebique Ferro-concrete Piling and Jetty Work. Must have had previous experience of this class of work. Probable duration of work, four months. Day and night work. State age, experience, salary required, and all necessary particulars.—Address, HENNEBIQUE, 18 Victoria Square, Newcastle on-Tyne.

TRAVELLERS, with connection amongst Architects, Local Government Authorities, and Corporations, are offered excellent side lines in Enamels, Varnishes, Paints, &c. Liberal commission—Box 2156, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

TRAVELLER, calling on Provincial Architects and Builders, to represent Midland firm, on commission; Ornamental Glass. Apply Box 2197, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

Drawings, Tracings &c.

AN ARTIST and DRAUGHTSMAN is prepared to undertake Architectural Drawings or Designs for manufacturing firms, either in office or at home. Perspectives, Illuminated Addresses, &c.—E.S.B., Box 1813, BUILDERS' JOURNAL Office, 6 Great New Street, Fetter Lane, E.C.

ARCHITECTURAL DRAWINGS, TRACINGS, &c., effectively executed by experienced Draughtsmen; very moderate terms.—STONE & COLQUHOUN, 6, York Buildings, Adelphi, W.C. 2189

ARCHITECT is prepared to undertake designs, working drawings, perspectives, &c.—Box 2204, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ASSISTANCE rendered in the preparation of Architectural Drawings, &c., at advertiser's own address.—Box 1717, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

DRAWINGS from rough Sketches, Designs, Details, Specifications, Drain Plans and Quantities Prepared; terms moderate.—J. W., 8, Rylett Crescent, Shepherd's Bush, W. 2207

PERSPECTIVES AND ELEVATIONS, Pencil, Ink, Monochrome or Colour. HART & COXON, 14, Clifford's Inn, Fleet Street, London, E.C. Established 14 years. Specimens sent.

"PRACTICAL STENCIL WORK."—A Guide to Designing and Cutting Stencils and executing stencil work for all purposes. Illustrated by many examples of ornamental stencil designs. Just Published. 3/-. "PRACTICAL GILDING, BRONZING AND LACQUERING," 3/-. Prospectus free. "THE DECORATOR" OFFICE, 365, Birkbeck Bank Chambers, London, W.C.

QUANTITIES AND SPECIFICATIONS ESTIMATES. (Nominal fee if unsuccessful). Experienced General Assistance, Competitions, Designs, Contract, Detail, and Working Drawings—Address, QUANTITY SURVEYORS, 21, Liverpool Street, E.C.

SEE PAGES XXXI AND XXXII FOR EMPLOYMENT REGISTER.

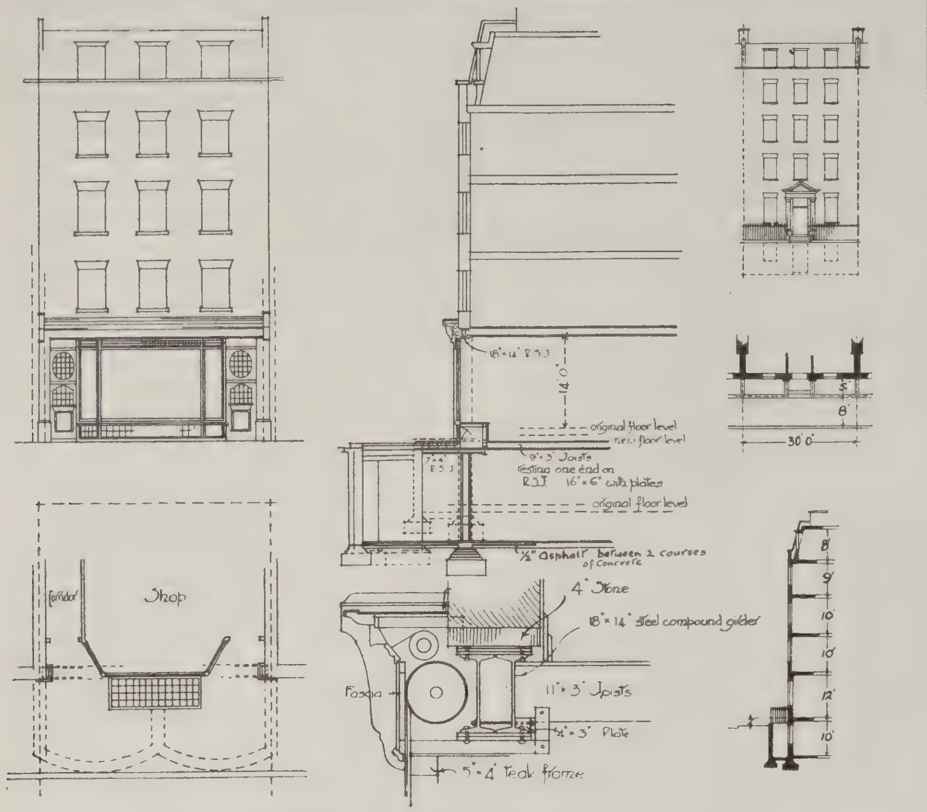
Buildings of the Year. In our issue for December 26th we shall publish an illustrated review of the architectural and building events of 1906. Readers will recollect that we published a similar review last year and in 1904, and we are gratified to know that these annual records were very much appreciated. They are, of course, quite unique in technical journalism. Through our ordinary news channels we are kept informed of what is going on in different parts of the Kingdom, but it is quite possible that there may be buildings of considerable merit which we do not hear of. We shall therefore be very grateful to readers who can let us know of any important buildings in their district which have been completed this year. It may, of course, happen that we already have these buildings on our list, but, on the other hand, we may be enabled to include some interesting examples of work which otherwise we should not be able to give. Will readers therefore kindly send us a card with any information, or, better still, with some photographs of important new buildings completed or begun this year.

St. Paul's: The position at Present. In our issue for last week we dealt with the circumstances which have arisen and have led to fears being entertained as to the danger of the fabric of St. Paul's Cathedral. We expressed the opinion that the building must at no distant date be underpinned, and urged that the work should be commenced at once. Since our issue, further information has been made public by the authorities, and we note that the advisory engineers, Messrs. Barry, Leslie and Co., take the same view as ourselves. A significant paragraph in their report is to the effect that an actual remedy would be found in underpinning the foundations of the whole south side of the structure down to the level of the London clay. This, they agree, would be a costly undertaking, but they suggest that it might be spread over a series of years. Mr. Mervyn Macartney, the architect to the Cathedral, has issued a statement to the effect that the danger is serious and urgent. He says:—"Having now submitted my report on the condition of St. Paul's Cathedral, the Dean and Chapter, in view of the grave importance of the matter, have decided, on my recommendation, to invite Mr. T. E. Collcutt, the president of the Royal Institute of British Architects, Sir Aston Webb, R.A., and Mr. John Belcher, A.R.A., to form a committee of inspection as to the condition and circumstances of the structure. The public may, therefore, be assured that their report and inspection will be an impartial one." The appointing of this independent committee is an entirely wise one. We are not in possession of Mr. Macartney's report, but it is stated that he views the risk involved in the construction of the London County Council sewer more seriously than the engineers, although it appears that the latter are far from half-hearted in objecting to this sewer, for they state in their report that "in view of the possible risk the Dean and Chapter may think it desirable to make representations to the London County Council to endeavour to persuade them to divert the course of the proposed sewer to the south." Further remarks of interest are contained in the engineers' report. "There is no doubt," they state, "that in the past there has been a general movement or 'draw' of the structure to the west and south which is clearly indicated by the evidence of subsidences along the south side of the building. Unfortunately, no exact records have been maintained, and we are therefore not in a position to say how far this 'draw' may be going on (if at all) at the present time. All we can say is that there has been a considerable movement, the south wall of the south transept being $4\frac{1}{2}$ins. to $5\frac{1}{2}$ins. out of the vertical, and the south-west clock tower being 6ins. or more out of the vertical." They further express the opinion that the movement to the west and south is continuous though slow, and they ascribe this, as we have done, to the drainage of the gravel overlying the London clay as the result of modern improvements. They mention that two arches over the west portico have been dislocated, and are now being repaired, but they point out that if, as they believe, the movement is continuous, they can regard repairs as being only temporarily beneficial.

A Municipal College of Arts. We notice that a proposal to establish a College of Fine Arts and School of Decorative Arts and Crafts at Edinburgh, on the Cattle Market site, has been approved by the Edinburgh Town Council. This proposal seems to be an excellent one, and Mr. MacGillivray, R.S.A., who is responsible for it, is to be congratulated. The school is not to reproduce any existing institution, but follows on the lines of some of the best Continental schools, being the outcome of a study of establishments at Paris, Berlin, Brussels, and elsewhere. There can be no doubt that what we particularly want in this country in the matter of architectural and art education is the co-ordination of the instruction given, and a widening of the outlook of each art by being brought into contact with the sister arts. We wish every success, therefore, to this Edinburgh scheme.



ANSWER TO QUESTION 1, SUBJECT VI.

R.I.B.A. EXAMINATIONS.

Model Answers by A. G. Bond, B.A., A.R.I.B.A.

The Final Examination.

(*Concluded from page* 210, *No.* 612.)

Paper VI. — CONSTRUCTION, FOUNDATIONS, WALLS, &C.

[*Not more than four questions to be answered, but question* 1 *must be attempted. Time of examination, three hours and a half.*]

1. — *The accompanying illustrations show part of a dwelling-house fronting a main thoroughfare. Prepare ¼-in. scale drawings showing how you would convert the dwelling-house into a shop. The ground floor must be 14ft. high, having properly-ventilated shop-front with roller shutters and stall-board lights. The basement to be 12ft. high, continued under the street pavement, and to be well lighted, ventilated, and dry, the subsoil water-level being 9ft. below street-pavement level. Also prepare 1in. scale drawings of details, and briefly describe the materials used.*

The processes of construction are briefly as follows.—Strut all windows, set up hoardings, excavate basement under pavement, build outer walls of vaults as dotted on plan, use raking-shores (four in number between windows). Pierce wall for needles and set up dead shores, all shores being taken down to basement floor. Remove brickwork between party walls and insert steel stanchions carried down to new basement level, and set on stone bases on concrete foundations. Put in steel bressummers at two levels shown and underpin to brickwork of front wall over upper ones, and make good. Build brick vaults over basement under pavement, with layers of asphalt over same, and where necessary within thickness of outer walls to keep all dry. Fill up with concrete and prepare for new pavement. Vertical damp-course should be continued as horizontal damp-course in thickness of concrete floor. After leaving to take up bearings, ease wedges of shores and gradually remove same; make good all holes in cement when shoring is removed. ———'s prismatic pavement lights to be used, supported at intervals on 7in. by 4in. steel joists across from joist under stall-board to wall of vault. Construct shop-front, using teak or Honduras mahogany, plate glass, roller blind, steel shutter, granite facing to steel stanchion and for consoles, &c.

(Such details of the construction could be given as time permitted—the section of the bressummer and positions of steel shutters and roller blind are shown on the accompanying illustrations.)

2.—*Draw ½-in. scale plans, sections and elevations, with templates, showing all stone vaulting, piers and window to one bay of an aisle, as illustrated by the accompanying plan. Describe briefly the principles of the construction. Only half of the window and a quadrant of the vaulting need be shown in detail.*

The principles of construction are briefly as follows :—The pointed arch is used, both for strength and adaptability to the varying spans necessitated by the diagonal and transverse ribs. The rib was introduced in order to lighten the whole construction and at the same time to concentrate the thrust on convenient points of support, such as the piers shown in the illustration. The ribs are the main constructional framework. They are arches formed of voussoirs with radiating joints and loaded with the infilling masonry which forms the actual "ceiling"; the infilling being kept as thin as is consistent with the duty of supporting its own weight over the interval between rib and rib, each being in itself a continuous arch or vault. The vaulting is shown as being slightly "domical" in form, the crown at the centre being higher than the apex of the transverse arches.

3.—*What is reinforced concrete? State its principles of construction, and show by rough sketches its application to floors, walls, roofs, piers, and retaining walls.*

Reinforced concrete is one of many terms applied to a system of construction in which steel is scientifically embedded in concrete in such position, proportion and form that the resulting construction has not only the tensional resistance of steel and the compressional resistance of concrete, but that those properties are even enhanced, while others, such as resistance to weather, shock and fire, are developed, and economy of materials is effected. The principle of construction is so to arrange the steel that it will most effectually, and at the same time economically, relieve the concrete of almost all tensional stress in whatever form that stress may arise—*e.g.*, shearing, torsion, buckling and splitting, &c.—and so to arrange the concrete that it will relieve the small steel reinforcing members of all undue compressional stress and at the

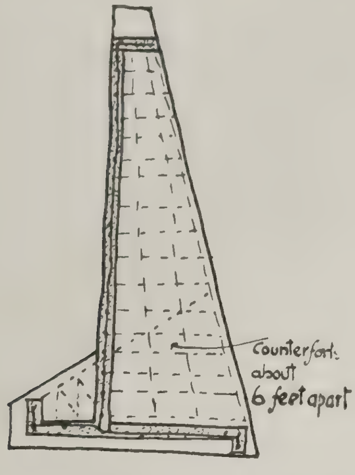

Fig 5.

same time thoroughly protect the steel from weather or possible exposure to fire. The accompanying sketches illustrate its application to floors (Fig. 1), walls (Fig. 2), roofs (Fig. 3), piers (Fig. 4), and retaining walls (Fig. 5). It will be seen that in each case the above-mentioned principles regulate the design of the reinforcing.

(N.B.—In the short time available, only such rough sketches as those shown could probably be given. Many other examples of the use of reinforced concrete will be found in THE BUILDERS' JOURNAL "Concrete and Steel Supplement.")

4.—*Draw to ½-in. scale a plan and section of a wooden gallery, 40ft. wide by 20ft. deep, to a church. No constructional ironwork is to be used and all dimensions of the various parts are to be given.*

A practical method of constructing this gallery would be by means of half trusses of "Princess-post" type placed about 8ft. apart and carried at one end on the back wall and at the other end on beams which are in turn supported partly on the side walls and partly on two-storey posts, as shown by the half plan. The strength of the various parts could be calculated by means of a reciprocal diagram and the usual formulæ if time permitted, allowing a load of from 1½ to 2 cwts. per ft. super. all over, but approximate sections are all that an examiner would expect. The purlins could be arranged on the back of the principals, with a light framework at the riser of each pew to support the small joists carrying the floor. The construction only is shown: architectural treatment could hardly be considered in the time at the candidate's disposal.

5.—*Draw to ½-in. scale a plan of a lead flat over an outbuilding, 20ft. by 15 ft., enclosed on three sides by parapet walls. The fourth side is the flank wall of the main building. The only connection to the drain is through a manhole opposite the centre of the 20ft. external wall. Give a section through the flat and through the gutter, and state the weights of the lead you would suggest.*

Only a key plan is given, as the construction is simple. As the boarding should run in the direction of the fall, it will be best to divide the plan up, as shown by dotted lines, with two binders 10ins. by 6ins. about 7ft. apart, and 5-in. by 3-in. joists 1ft. apart. The binders and wall-plate could be placed slightly out of the horizontal so as to give a fall of 1½ins. or 2ins. in 10ft. One drip would be sufficient: a detail is given of the drip and gutter and the lead-lined cesspool.

Subject VII.—CONSTRUCTION IN IRON AND STEEL: SHORING, UNDERPINNING, AND DEALING WITH RUINOUS AND DANGEROUS STRUCTURES.

(*Time of examination, three hours. Maximum number of marks,* 125.)

1*a*. There is a row of warehouses, 50ft. deep, out to out, and 15ft. frontage, centre to centre, each. It is desired to unite the centre pair on *the ground floor* by the removal of the party wall which carries the 14-in. thick brick wall over, and insert steel girders in lieu of the wall, the girders carried on stanchions. The warehouses consist of ground floor 12ft. high, first and second floors 10ft. high each, all floor to floor, and the top or third floor 9ft. high in clear. The floors in all cases are carried on 9-in. by 3-in. wooden joists running from party wall to party wall, and the roof is of 10-ins. of concrete (average thickness) covered with asphalt. The parapet between the buildings is 3ft. above the top of the asphalt. Sketch section of party wall and girder to ¼-in. scale.

b. Assuming the party wall a sound one, how do you proceed to remove the ground-floor wall? Give sketches explanatory of the work to be done.

c. What is the total weight the girders will have to carry, assuming the warehouse floors have to bear a weight safely of 2½ cwts. to the foot, including the floor itself?

d. The girders rest on the front and back wall at either end, and on two stanchions between the external walls, forming three equal openings between the front and back walls. Give one-quarter-full-size section of girders, and figure the dimensions.

e. Calculate the horizontal plan and section of each stanchion. Draw same quarter-full-size, figuring all parts. State whether you intend the stanchion to be steel or cast-iron in your sketch.

f. Draw to quarter-full-size elevation of the head of the stanchion, and elevation of the girders immediately over one stanchion: the girders to be in three lengths, meeting over the heads of the stanchions.

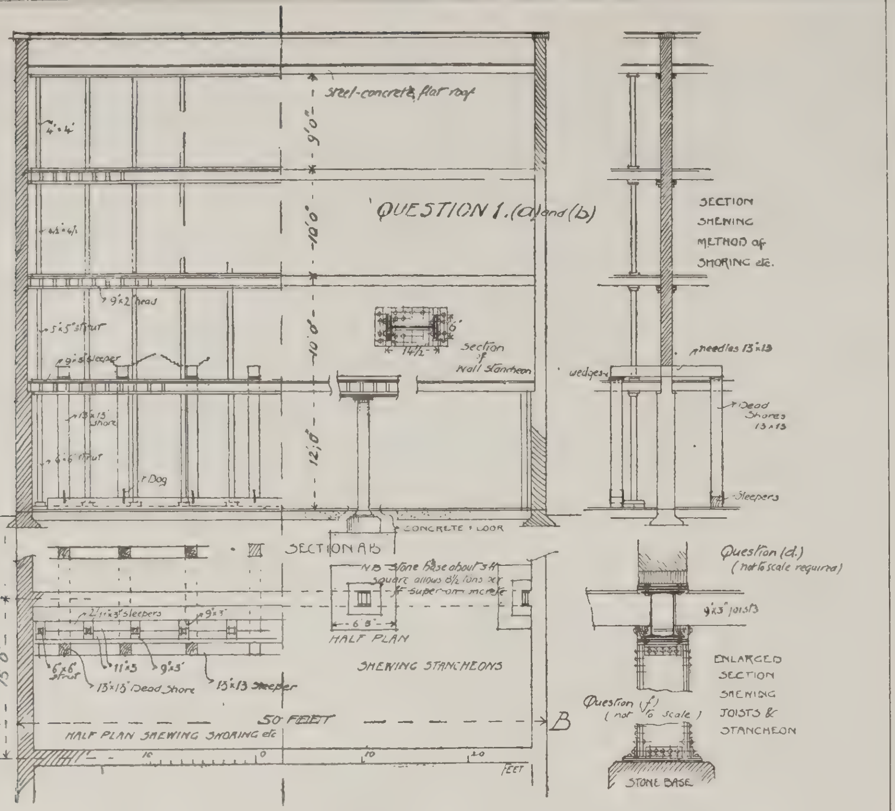
g. If the front wall is at all insecure from bulges or cracks, how would you support it during the insertion of the girders, and afterwards?

See illustrations on next page.

(The thicknesses of walls are as given in the question; they are not according to the Building Act nor the Model By-Laws.) This question shows the importance of reading through the whole paper before attempting the answer to any question, as it is only when the candidate comes to question (*d*) that it is made clear how the girder is divided up by stanchions and, consequently, what proportion of the total load each girder and stanchion has to bear. As there are two intermediate stanchions (see plan) it would be quite possible to deal with each third part of the party wall as a separate piece of shoring and underpinning, and, other things being equal, this would certainly be the safest plan to adopt. Again, it is often a question what proportion of the total superstructure is really carried by a bressummer. In a long continuous wall in which an opening has to be made it may often be the case that, with the exception of a portion of the brickwork within an angle of about 60 degs. between stanchion and stanchion, no weight at all will ultimately be carried by the girder spanning the opening, owing to the adhesion of mortar and the sound bonding of the bricks, but in this case, as the whole wall is to be taken away on the ground floor, it would hardly be safe to count on the support of the external walls to hold up any appreciable portion of the party wall, either during the operations or after they are complete, and as it might well be a matter of importance that the whole work should be carried out in one operation in order to save time, the first consideration may also be disregarded in answering this question.)

(*b*) It is here assumed, therefore, that the whole superincumbent load is to be borne by the girders and the four stanchions, and also that the whole of the party wall has to be shored up and the alteration carried out in one operation. The illustration shows the method suggested for the shoring or temporary support. First the floors which are directly carried by the party wall are strutted up by timbers varying from 6ins. by 6ins. on the ground floor to 4ins. by 4ins. on the top floor, standing on sleepers or sole-pieces 9ins. by 3ins. (further spread on the ground floor to prevent possible damage) and with head-pieces under the joists 9ins. by 2ins. (N.B.—In dealing with a party wall so slender in proportion to its height it might be advisable to use flying shores from party wall to party wall on the two floors above the ground floor, on both sides of the wall in question, but the support of the floor joists resting on these walls is here assumed to be sufficient.) Next the walls have to be needled and the dead shores set up: these have now only the weight of the walls to carry—not a very serious matter, as, if the shores are placed about 6ft. apart, centre to centre, the weight of the brickwork on each would be approximately 30ft. × 5ft. × 1⅙ft. × 1 cwt. (per ft. cube) = 175 cwts., while the needles shown (13ins. by 13ins.) would easily carry a heavier load.

The part of the question (*g*) shows that a further shoring might be rendered necessary owing to the insecurity of the front wall: temporarily it would be possible to make it secure by a system of raking shores, but for permanently securing it something better will be needed, and if done in the first instance would obviate the necessity of the raking shores. The process referred to would be the use of iron rods and face-plates; the rods would pass close to the underside of the joists; the process is further described under (*g*). (N.B.—The method of removing the shoring might then be de-



ANSWER TO QUESTION 1, SUBJECT VII.

scribed shortly, but the question does not really require this.)

(*c*) We now come to the calculations for the permanent work. As at first stated, we assume that the whole weight of wall, floors and roof is carried by the girders, each of which carries one-third of the total. The wall is 48ft. by 33ft. by 1⅙ft., or has a total cubical measurement of 1,848 cub. ft., which will weigh, approximately, 90 tons. The weight of the roof may be taken as the same as for floors (it might be used for stacking goods), so that, as half the weight of each floor on both sides comes on the party wall, the total weight will be $\frac{4 \times 15 \times 48 \times 2\frac{1}{2}}{20}$ tons $= 360$. Therefore the total load will be 450 tons, which will give 150 tons on each girder. The span of the girders (assumed to be a pair of rolled steel joists with plates) is approximately 16ft. As the load is taken at its maximum, a factor of safety of 3 is sufficient. Making use of the formula $W = \frac{CAD}{L}$ and with a constant of 10 for breaking weight at the centre $\left(\text{or } \frac{10 \times 2}{3} = 6\frac{2}{3} \text{ safe distributed load}\right)$ and assuming that depth is 16ins., as the load is a heavy one, we get

$$A = \frac{W \times L}{C \times D} = \frac{150 \times 16 \times 3}{16 \times 20} = \frac{45}{2}.$$

Now the width should be about 14ins.; hence the thickness of the flanges and plates should be $\frac{45}{2} \times \frac{1}{14} = 1{\cdot}6$, or say 1¾. Then if the average thickness of flange is ¾in., two ½in. plates are to be added. The depth is to be 16ins.; therefore two 14in. by 6in. joists will do—the plates being say 14½ins. wide. (As a low factor of safety has been taken, the effective area of webs—one-sixth—has been neglected in the above calculations.)

(*d*) A sketch is given with the illustrations, but not to scale: the candidate would, of course, draw it to the scale required.

(*e*) The stanchions will be calculated to carry loads as follows:—The two end ones each take ⅙th of the total, the two intermediate ones each take ⅓rd of the total. It will be sufficient to calculate one of the end ones, and to use a pair of similar ones at each of the intermediate points. The weight of girders can be disregarded. Metal assumed to be rolled steel I section; height of stanchion, 12ft.; smaller cross dimension, $\frac{1}{24}$th of height = 6ins.; load to be carried $\frac{450}{6} = 75$ tons; allowance of safe load for the proportion of height to least width assumed, say, 4 tons per sq. in.; required area of metal in sq. ins., $\frac{75}{4} = 19$; longer dimensions of stanchion to be 14½ins. to suit width of girder over. Taking web as ½in. thick, and approximately 12ins. long between flanges, we get an area of 6 sq. ins. in the web, leaving $19 - 6 = 13$ sq. ins. to be provided by flanges, which, if made 1¼ins. thick (including the plates) will each have a sectional area of 7½ sq. ins., giving a total of 21 sq. ins., which will be ample for the purpose. (This result could be checked by the use of Gordon's formula if time permitted. Find the breaking weight from the dimensions assumed; the result divided by the load to be carried will show what factor of safety we have allowed.) In order to complete the sketches it would be well to assume the nature of the subsoil—say, hard clay—and allow, say, 2 tons per ft. super. for safe loading: this would give an area at base of concrete under intermediate stanchions of about $\frac{76}{2}$, or 38ft. super, or about 6ft. 3ins. square.

(*f*) The answer to this question is only suggested by small scale sketches, as numerous examples of a similar kind are to be found in the back numbers of this Journal.

(*g*) The cause of either defect in the wall should be ascertained and, if possible, removed or minimised. In this case, as no weights come on the front wall from floors, &c., the cause is probably bad brickwork or insufficient thickness: an inadequate proportion of headers might cause the wall to divide vertically. Bulges might be prevented from becoming worse both temporarily and permanently by means of iron rods passing through the building from back to front, and passing through plates at convenient intervals on face of front and back walls, with threads at the ends and screw-nuts and washers: the iron rods would be heated and the screws then tightened, so that the contraction on cooling would tend to draw in the bulging parts of the wall. If the wall is found to be divided vertically into two parts it might be advisable to draw occasional bricks and insert new headers in blue brick in cement, and, previously, to utilise the holes thus made for pouring in liquid cement grouting.

Cracks might be due to several causes—for instance (1) settlement of part of the wall owing to insecure foundations (this could only be remedied by underpinning); (2) outward pressure from floors or roof (apparently it is not so in this case, but if it were so there would probably be corresponding bulges at the points of pressure, and the remedy is given above); (3) parts of the wall might have settled more quickly than other parts and thus have caused cracks (the remedy would be to draw all the snapped headers and insert new ones in cement); (4) cracks in such a case would possibly be due to the weight of concrete flat partly resting on a wall of great height without any intermediate ties, as all the floor joists rest on the party walls.

[*Answers to the questions set in the Intermediate Examination were given in our issues for July 11th, July 25th and August 8th last, and to Subjects I., II., III., IV. and V. of the Final Examination in the issues for September 5th, September 26th, October 17th and October 31st.*]

Obituary

The late Mr. Joseph Elliot, builder, contractor, and quarry owner, of North Shields, who died on September 5th, left estate which has been proved at £50,219 gross.

Mr. Arthur Smith, borough surveyor, of Dartmouth, committed suicide last week, as the result of certain financial irregularities in his department.

Mr. H. A. Prothero, M.A., F.R.I.B.A., the well-known ecclesiastical architect and authority on Gothic, died in Cheltenham on November 25th in his 58th year. Mr. Prothero was educated at Cheltenham College and Balliol, Oxford. He designed the new chapel at Cheltenham College, was architect for the Cheltenham Ladies' College, and designed additions to many churches in Cheltenham and neighbourhood; also new churches in various parts of the country.

A new Street Improvement Plan for Newcastle-on-Tyne was outlined by Mr. J. T. Cackett, F.R.I.B.A., in his recent presidential address to the Northern Architectural Association. It is to Mr. Cackett's address last year that Newcastle practically owes the present scheme for developing the New Bridge Street area. Mr. Cackett now extends his former plan for the utilisation of the lower area and the linking up of Mosley Street with New Bridge Street.

THE ARCHITECTURAL REVIEW.

"The Architectural Review" for December is a particularly interesting issue. The new War Office in Whitehall is illustrated by sixteen photographic views, together with plans of the building, and a descriptive article by Mr. Clyde Young, who has carried to completion the design of his father, the late Mr. William Young, F.R.I.B.A. Another interesting feature of the issue is an article on the Churches of Sicily by Mr. Ronald P. Jones, M.A., while Mr. A. C. Champneys gives a further instalment of "Irish Ecclesiastical Architecture." The "Exemplar" this month comprises Gothic canopies, and "Current Architecture" is represented by eleven views of a large house at Farthingstone, Northants, by Mr. Walter Cave. Some most commendable students' designs done in the Architectural Association School of Architecture also add to the interest of the issue.

R.I.B.A.

A business meeting of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W.

The following were elected :—

As Fellows (77).

W. Adamson (Cape Town)
G. L. Beattie, A.M.I.C.E. (Edinburgh)
George Bell (Glasgow)
Edward M. Blake (Wellington, N.Z.)
J. H. Blizard, A.M.I.C.E. (Southampton)
Detmar J. Blow (London)
Cecil C. Brewer (London)
W. L. Trant Brown (London)
R. M. Butler (Dublin)
W. H. Dashwood Caple (Cardiff)
F. J. C. Carruthers (Dumfries)
M. E. Collins (London)
A. S. Conrad (Adelaide)
William Cooper (Huddersfield)
W. M. Cowdell (Leicester)
H. Bulkeley Creswell (London and Rugby)
W. Crichton (Wellington, N.Z.)
James Davidson (Coatbridge)
W. L. Eves (Uxbridge)
J. Fasnacht (London)
W. J. Fennell (Belfast)
H. W. Finch (London)
E. W. Fritchley (Bombay)
J. G. Gillespie (Glasgow)
George W. Hamilton-Gordon (Bloemfontein)
Claude Harrison (London)
F. M. Harvey (London)
P. L. Henderson (Edinburgh)
R. A. Hinds (London)
G. S. Hudson (Durban)
A. R. Jemmett (London)
W. J. Kemp (London)
Sydney D. Kitson (Leeds)
W. G. B. Lewis (London)
J. H. McKay (Wellington, N.Z.)
J. C. McKellar (Glasgow)
C. R. Mackintosh (Glasgow)
W. H. McNab (Glasgow)
Duncan McNaughtan (Glasgow)
A. Macpherson (Edinburgh)
[illegible]. Macwhannell (Glasgow)
H. E. Mathews (East Grinstead)
S. J. May (London)
Graham Nicholas (Halifax)
W. T. Oldrieve (Edinburgh)
J. W. Paton (Durban)
J. P. Pritchett (Darlington)
E. K. Purchase (London)
Walter Reid (Johannesburg, Cape Town and Bloemfontein)
David Robertson (Edinburgh)
W. W. Robertson (Edinburgh)
James Salmon (Glasgow)
J. Simpson (Bolton and Liverpool)
E. W. Sloper (Johannesburg)
A. P. Small (Ross)
A. Dunbar Smith (London)
A. Steinthal (Manchester)
Harold Sudlow (Calcutta)
Alfred Swash (Newport, Mon.)
H. Ramsay Taylor (Edinburgh)
Isaac Taylor (Manchester)
Sir Alfred Brumwell Thomas (London)
R. W. Thomas (Llandrindod Wells)
J. Baird Thomson (Glasgow)
W. A. Thomson (Glasgow)
G. A. Troup (Wellington, N.Z.)
W. J. Waghorne (Calcutta)
W. S. Walker (Hull and Bridlington)
W. T. M. Walker (London)
John Waterson (Johannesburg)
John Watson (Edinburgh)
W. F. Wilkie (Dundee)
J. Leonard Williams (London)
C. L. Wilson (Cardiff)
G. E. Withers (London)
E. Woodhouse (Manchester)
P. Scott Worthington (Manchester)

As Associates (57).

Dennis Bamford (London)
H. Blackadder (London)
A. G. Bray (Blackburn)
A. E. Brooker (London)
W. W. J. Calthrop (London)
H. R. Coales (Leatherhead)
A. Bulloch (London)
O. H. Cockrill (Great Yarmouth)
T. H. O. Collings (Brighton)
W. H. H. Cooke (London)
R. W. A. J. Cosway (London)
H. B. Downs (Guiseley)
C. W. Eaton (Bolton)
E. H. Edleston (Nantwich)
G. A. Farrar (Manchester)
F. H. Fitzgerald (London)
F. J. Forster (London)
F. B. Foster (Weston-super-Mare)
J. B. Fulton (London)
E. H. Gandy (Wolverhampton)
L. M. Gotch (London)
A. C. Goulder (London)
J. W. Hepburn (London)
G. B. H. Hoole (London)
P. C. Hoy (Manchester)
F. J. Humphry (Surbiton)
D. B. Hutton (Glasgow)
E. T. Jago (London)
E. R. Kennedy (Belfast)
C. C. Makins (London)
H. J. C. Marshall (London)
H. Moss (Bolton)
S. Moss (Liverpool)
J. E. Mundell (Poole)
H. F. Murrell (London)
J. Newton (London)
J. Parlett (London)
S. H. Penlington (Bristol)
G. E. Phillips (London)
H. A. Rowbotham (London)
J. Rycroft (Bradford)
W. P. Rylatt (Leeds)
J. P. Salwey (London)
V. G. Santo (Shrewsbury)
W. P. Schofield (Leeds)
H. Shackleton (Keighley)
J. Smith (Glasgow)
F. A. Sprules (Sheffield)
F. G. Stockdale (London)
C. R. Thickpenny (Watford)
W. I. Travers (London)
E. H. Walker (London)
Ewart G. Walker (London)
B. M. Ward (Birkenhead)
Bryan Watson (London)
B. C. Westwick (Mansfield)
A. Woodeson (Colombo)

Admission of Candidates to Fellowship.

The chairman brought forward a proposal, on the suggestion of the Council, that, pending the settlement of the larger questions involved in the revision of the Charter and By-laws of the Institute (suggested by the Registration Committee and adopted in principle by the General Body, but referred to the Council for a report), they continue to act under the old By-law No. 3—relating to the admission of candidates to Fellowship—(it not having yet received in its amended form the sanction of the Privy Council) until such time as all changes may be made together, the Council undertaking in the meantime to act in accordance with the spirit of the proposed by-law until it comes regularly into force.

We understand it was eventually resolved that the date "December 31st, 1906," in the resolution of February 29th, 1904, should be extended to December 31st, 1907. This, presumably, gives another year of life to admission to Fellowship under the present regime.

Rural Building By-Laws.

Mr. Lacy W. Ridge, F.R.I.B.A., moved: "That the Royal Institute of British Architects is of opinion that the provisions of 'The Public Health Act (Building By-laws) Bill, 1906,' which has already passed the House of Lords and is now sent to the House of Commons, will, when enacted, prove advantageous in facilitating building operations in rural districts." This was agreed to.

Public Officials acting as Architects for Public Buildings.

Mr. Herbert W. Wills, A.R.I.B.A., moved "that the Royal Institute of British Architects considers it inadvisable in the interests of architecture that public officials should act as architects for public buildings." This was agreed to, with the addition of the words "unless they have had an architectural training." A second motion by Mr. Wills on the same subject was withdrawn. It was as follows: "That the Council of the Institute should obtain statistics of the sums paid to official architects, surveyors and engineers and their staffs, with a view to instituting a comparison between such sums and the fees which would be paid to outside architects for similar work, in order that, if the latter charges compare favourably with the former, they should approach those public bodies who already employ, or are contemplating employing, officials, with a view to securing the abandonment of such a system."

Notes on Competitions

Holborn Municipal Buildings.

It will be recollected that a competition was held this summer for new municipal buildings for Holborn, to be erected adjoining the free library. Messrs. Warwick & Hall were the successful architects; their design was given in our issue for July 18th. Since the decision of the competition, however, a protest against the scheme has been engineered by the members of the new Council, and at a special meeting on Wednesday Councillor Chapman brought forward a motion to rescind all resolutions on the matter. He estimated they could save the ratepayers £20,000 by the adoption of an alternative scheme. The contractor, the architects, and other officials could be compensated. This proposal, however, was defeated by a large majority.

Partington Convalescent and Nurses' Home, Glossop.

In addition to the first three designs, the following received special mention in the assessor's award:—Mr. Stuart M. Mould, Newcastle-upon-Tyne; Mr. C. Worby Beaumont, London; Mr. J. A. Minty, London; Mr. J. J. Wood, Leeds.

London County Hall.

At last week's meeting of the London County Council the Establishment Committee recommended that, in respect of the eight architects who are to be invited to compete for the new County Hall with the architects (not fewer than 10 nor more than 15) selected in the preliminary competition, the time for sending in their designs should be extended to the date for the final competition, instead of the date for the preliminary competition, as first suggested; this in order to give them more time to do justice to their work. The Council approved the recommendation.

A Prize Scheme.

At the recent smoking concert of the associates' section of the Edinburgh Architectural Association particulars of a prize scheme were circulated. We extract the following:—

General Conditions.—All designs to be sent in under a motto unknown to the competitor. Conscientious objectors need not compete in the Gothic competition. Those entering for the competitions must use these conditions as a coupon—the competitor having the greatest number of coupons will be adjudged the winner. The committee cannot guarantee the winner receiving his prize money, as the treasurer has done the same thing before. The drawings to be executed slowly on the inside of the paper.

A—Design for a Country Mansion for an Architectural Draughtsman.—Cost not to be less than £50,000, at 4d. per cubic foot. *Accommodation required.*—Mainly smoking-rooms ensuite. The drawing-room to be made as stuffy as possible, in order to give a homelike feeling. *Drawings required.*—Plan of butler looking up, full size. Drain plan showing mantraps. The competitor must consider the advisability of changing the design into a municipal art school. The planning, however, will be the same in both cases. *Prize.*—100 vols. of the Association's "Transactions."

B—Design for a Gothic 14th century psuedo-peripteral Shop Front, with portico in several antis.—Drawings required.—Plans showing how you did it. The designs should be according to the principles laid down by Goodnewyear in his "Mental Afflictions."

C—Prize for Apprentices. Design for a "Draughtsman's Crib" in the "modern mean style."—Drawings required.—Full-size detail of a cheque.

A new School at Maidstone.

We notice that at the last meeting of the Maidstone Town Council considerable discussion arose in regard to the new school which it is proposed to erect in the borough. Plans had been drawn up by the borough surveyor, and the committee in charge of the matter recommended that these plans should be adopted, urging the old fallacious argument about not spending the ratepayers' money by putting the work in the hands of "an architect who would charge 5 per cent." We are glad, however, that one councillor was well-informed enough to point out that he did not see where the saving would be effected, and he expressed the opinion that if they had the services of local architects they would get a choice of plans, and, perhaps, a better one than the surveyor could prepare, for the same amount—if not for less. At the last meeting of the committee an amendment was proposed inviting local architects to send in plans, but it was lost by one vote. The mayor said he did not wish to say one word against architects, "but they were as a rule somewhat extravagant in their business and that had to be paid for. . . . By employing their surveyor there would be a saving of £300 of the ratepayers' money in architect's fees at 4 per cent., and there would, he believed, be a saving of something like £1 per head per child in the erection of the school, which would mean a sum of £600 to £700." Eventually 8 aldermen voted for the work being placed in the hands of the borough surveyor and 8 for the work being given out to a local architect. The mayor gave his casting vote in favour of the former arrangement, so it is now definitely settled that there shall not be any competition for the school.

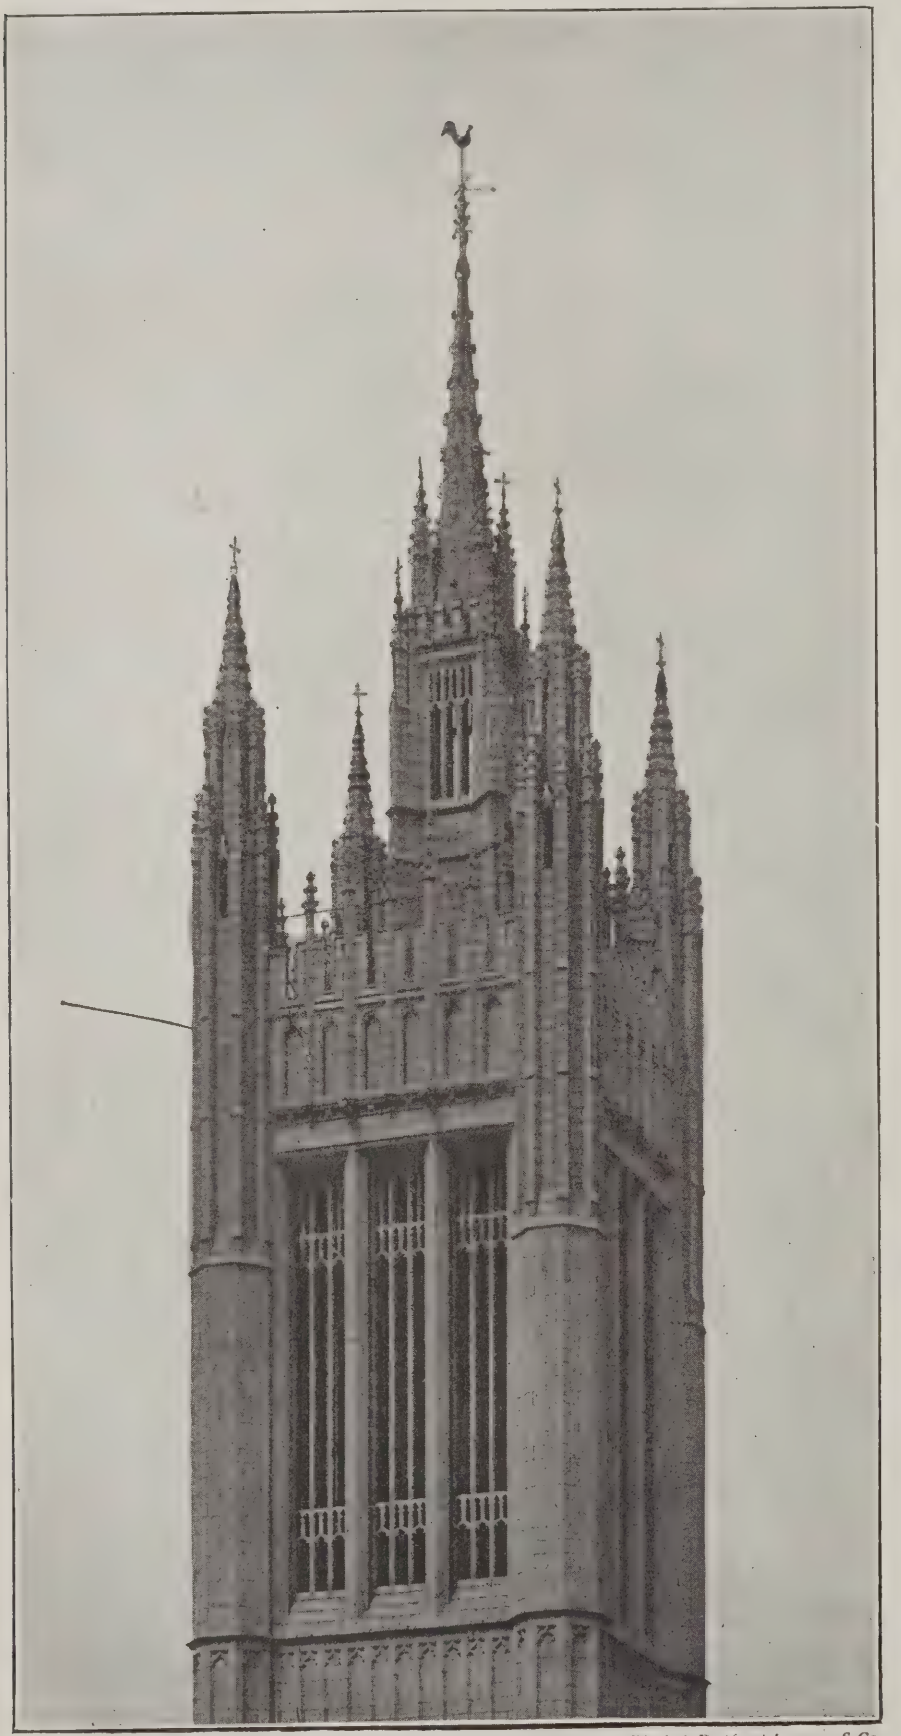


Photo: Bedford Lemere & Co.

THE UPPER PART OF THE TOWER OF MARISCHAL COLLEGE, ABERDEEN.
A. MARSHALL MACKENZIE AND SON, ARCHITECTS.

New Baths at Sheffield.

In the competition for new public baths to be erected at Primrose Meadows, Sheffield, seventeen designs were submitted. The assessor, Mr. J. Lane Fox, of Leeds, has made the following award:—1st, No. 8, by Mr. A. Nunweek; 2nd, No. 14, by Messrs. Charles M. Hadfield and Son; 3rd, No. 9, by Messrs. Potter and Sandford—all of Sheffield.

List of Competitions Open.

Deposit for conditions given where known.

DATE OF DELIVERY	COMPETITION.
Dec. 31	LABOURERS' COTTAGES AT DUBLIN.—Premiums of £50, £30 and £20. Particulars from A. R. Barlas, secretary, L.G.B. Offices, Dublin. No deposit.
Dec. 31	DUAL SECONDARY SCHOOL AT GOOLE.—Premiums £50 and £25. Particulars from James W. Johnson, clerk to Governors, Council Offices, Goole. Deposit £2 2s.
Dec. 31	NURSES' HOME AT GENERAL HOSPITAL, WOLVERHAMPTON.—Particulars from J. Stephen Neil, House Governor and Secretary, General Hospital, Wolverhampton. No deposit.
Dec. 31	BATHS AT ASHTON-IN-MAKERFIELD.—Limited to architects in Wigan and Leigh Poor Law Unions. Particulars from A. Sykes, clerk, Council Offices, Ashton-in-Makerfield. No deposit.
1907 Jan. 12	LAY-OUT OF RIDDRIE ESTATE, GLASGOW.—Premiums of £75, £50 and £25. Particulars from A. W. Myles, town clerk, City Chambers, Glasgow. No deposit.
Jan. 19	LIBRARY AT PLYMOUTH.—Premiums £50, £30 and £20. MUSEUM AND ART GALLERY AT PLYMOUTH. Premiums £25, £20 and £10. Limited to local architects. Particulars from Borough Librarian, Plymouth.
Feb. 1	CHILDREN'S HOSPITAL AT SUNDERLAND.—Premiums of £100, £50 and £25. Particulars from T. Robinson, secretary, Infirmary Offices, Bank Buildings, Sunderland. Deposit £1 1s.
No date.	CONGREGATIONAL CHURCH, SCHOOL AND MANSE, GRIMSBY.—To cost £8,200. Premiums of 25, 15 and 10 guineas. Particulars from E. L. Bridge, Fish Docks, Grimsby. Deposit £2 2s.

Our Plates

House at Shortlands, Bromley.

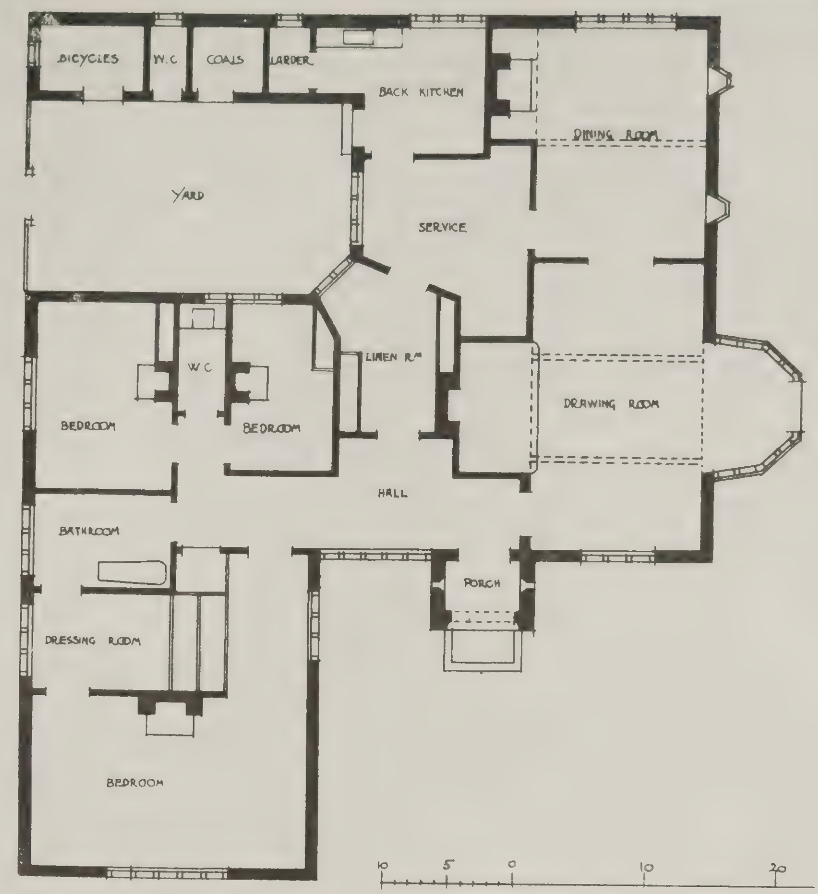
The house is designed to suit the particular wishes of the owner. The drawing-room and dining-room have open timber roofs, the partition between the two rooms being glazed with lead lights and clear glass in the upper part, so that the roof can be seen running throughout the entire length. The walls of these rooms are in half-timbering. The bedrooms are fitted with basins and wardrobes as fixtures. Externally the materials are Kent tiles for walls and roof, half-timbering, and rough-cast, the porch being of a warm-coloured stone. Mr. Alfred Cox, F.R.I.B.A., of 4, Adam Street, Adelphi, was the architect, and Messrs. Thomas Crossley and Son, of Bromley, Kent, were the builders.

House at Sidmouth.

This house was designed for a site with a fall of 1 in 5: hence the elongated plan, which saves excavation and brickwork. The house is built on the Sidmouth Manor estate. The walls are hollow, rough-cast outside, and the roof is covered with hand-made tiles. Mr. R. W. Sampson, of Sidmouth, was the architect, and Messrs. R. W. & J. Skinner, of Sidmouth, were the contractors.

House at Hampton Hill.

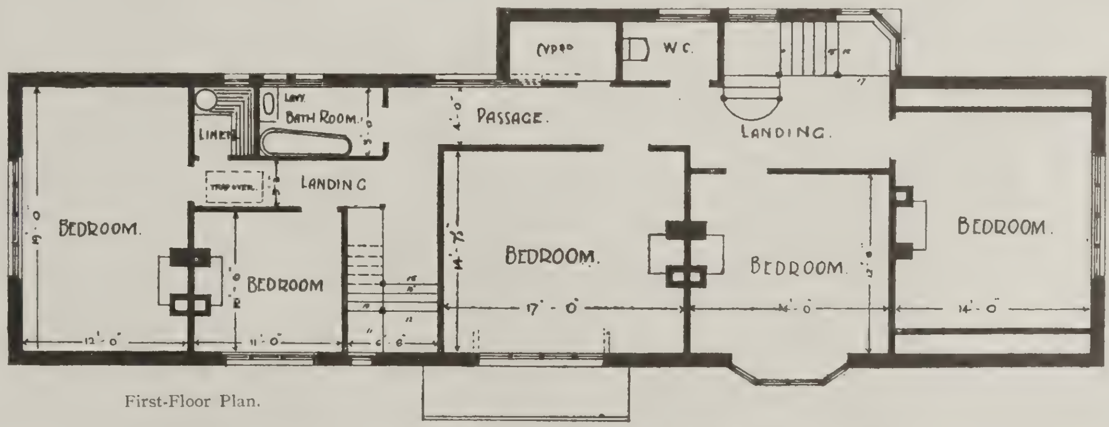
This house is one of a number now in course of erection in Park Road, Hampton Hill, Middlesex, for Mr. J. Curtis. It is rough-cast externally and roofed with red sand-faced tiles laid on a series of tiling fillets at the gable ends so as to throw the gables slightly out of the angle of 45 degs.; at the same time the main roof remains at 45 degs. The windows are divided into small squares with wooden bars. The front door and part of the internal joinery work is in oak. The ground-floor accommodation is shown on the illustration. The first floor comprises five bedrooms, bathroom, linen closet, &c.; the attic one bedroom, and boxrooms; coal and wine cellar and additional larder in the basement. Messrs. Castle and Warren, of Aulaby Road, Teddington, are the architects.



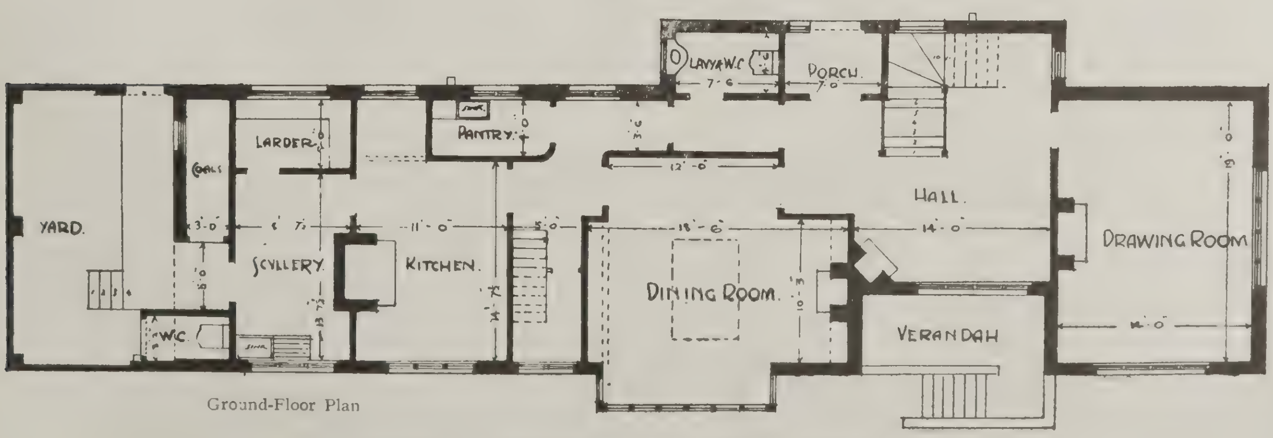
HOUSE AT SHORTLANDS, BROMLEY, KENT. ALFRED COX, F.R.I.B.A., ARCHITECT.

Riverside Bungalow near Reading.

The chief features of this bungalow are a living-room, with roomy ingle-nook, communicating direct with dining-room by means of folding doors, thus forming, when required, one large entertaining room. The square entrance-hall and living-room are panelled in oak, with ceiling beams exposed. The walls up to ground-floor sills are built of local red red bricks, and the walls are stuccoed, finished dead white. The outside timber work is formed of solid oak; the roofs of the bungalow are covered with sand-faced red tiles. Mr. W. P. Watson, of Loughborough, is the architect.



First-Floor Plan.



Ground-Floor Plan

HOUSE AT SIDMOUTH. R. W. SAMPSON, ARCHITECT.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side o the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Pitch of Rivets in Girder.

MANCHESTER.—J. C. writes: "What is the theoretical pitch of riveting for a compound girder, say, 20ft. span, composed of two 20ins. by $7\frac{1}{2}$ins. rolled steel joists and six 14ins. by $\frac{1}{2}$in. plates? Is there a formula for such a case?"

The proper pitch for the rivets of a built-up girder cannot be determined from the dimensions of the plates. It depends upon the horizontal shear. This is explained in detail in "Designing Ironwork," Second Series, Part I., "Steel Box Girders" (Spon, 1s. 6d.).

Sale of Land for Building.

NOTTS.—T. writes: "Some time ago a client of mine purchased a plot of ground in a private avenue for the purpose of erecting a house thereon. The conveyance imposes the usual building conditions, as to the class of building to be erected, rental, &c., and all this has been faithfully observed, and the house completed. I now find that the vendor has offered for sale the remaining ground for building purposes. This is calculated to depreciate the value of my house considerably, although the purchaser was bound by the conditions from erecting such a building; and, further, my client was given the impression from verbal statement of the vendor that the avenue would be kept for erecting houses of similar class to my client's. There is no clause mentioned empowering the vendor to do this. What is the remedy, and what steps should be taken?"

This is a case in which I should recommend you to consult a solicitor at once, as the reply to your question entirely depends on the circumstances under which your client originally bought, and the wording of the contract for sale, as well as of the conveyance itself. If the property were publicly offered for sale by auction with restrictive covenants upon it, *and a portion then sold,* the vendor is bound by the restrictions in respect of the land unsold, and he cannot afterwards alter them by his mere *ipse dixit.* A verbal statement in such a case is probably worthless, though it is quite possible that it might render the utterer liable for damages caused. F. S. I.

Measuring Road with Hedge.

LIVERPOOL.—OFFSET writes: "Which is the correct way to measure land fronting a country road with a hedge and ditch at the side? Do you allow 4ft. from the butt of the hedge for the ditch in the usual way? Have not county councils powers to fill in the ditch at the side of a road, and to pave and use the land occupied by it? If so, the land should be measured to the butt of the hedge only, the area of the ditch not being included."

The boundary of the property is the outer edge of the ditch, not the stakeroot of the hedge, and naturally one would measure to the boundary. In most districts 4ft. is the accepted distance from the stakeroot, which should be adopted. County councils have no such power as that described. F. S. I.

A Church Scheme.

PLUMSTEAD.—H. W. writes: "A building committee to which I am secretary are about to have a set of plans prepared for a new church, schools, &c. What is their legal position in the following circumstances?—It will not be possible to build in a less time than three to five years. We propose to arrange with an architect for a definite sum, so that we may have an idea to set before our people and the invited subscribers. This having been done, could the architect, under the conditions, claim any further payment if after three or five years the committee proceeded with the job, employed a quantity clerk, issued contracts themselves, and engaged a clerk of works to superintend the job?"

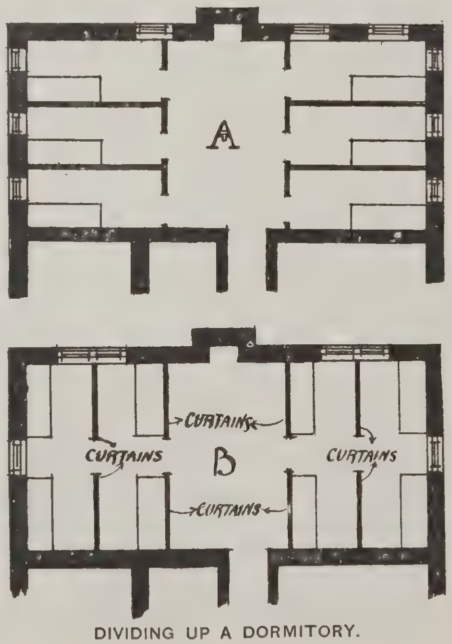
You should make a definite offer to your architect in the way you wish, and he can then refuse your terms if he does not care to entertain them. Once having obtained a straightforward bargain in writing, the committee may use the preliminary plans in their own way; but I confess the method suggested does not appear to me to be a very economical one, and will probably end in disaster. You had much better pay an architect for the preliminary drawings upon the understanding that if you should afterwards decide to entrust him with the work the cost of these preliminary sketches should be deducted from his commission.

F. S. I.

Dividing up a Dormitory.

HARROGATE.—OLD SUBSCRIBER writes: "It is proposed to divide the dormitory shown on the accompanying plan into cubicles for boys. What is the least size that could be used? How will the room best divide up to get maximum number of beds, and what is the usual construction of the cubicles—height, &c.? Is is usual to have doors? The existing floor is of wood."

The room is of unsuitable width to provide for a model dormitory. The windows, also, are badly spaced and of insufficient area. It will be well to remember that any work done should comply with the Board of Education's ruling. A cubicle, if enclosed, should provide for at least 65 to 70ft. of floor area and be of about 700ft. cube. It can be open above 7ft. 6ins. and the partitions framed and matchboarded. The door is best placed opposite the bed to allow it to be run into the gangway. The better scheme is shown in figure A. The Board of Education's present ruling permits 8 beds. These could be curtained off and placed as in scheme B. T.



DIVIDING UP A DORMITORY.

A Small Road Bridge.

JUNIOR writes: "Which is the best method of bridging a small stream? The roadway is 30ft. wide and the abutment walls are 8ft. apart. The bridge is to be of steel, and capable of sustaining traction engine traffic. A minimum depth of construction is important."

Dorman, Long & Co.'s trough girders will form the best bridge floor for a span of 8ft. and a width of 30ft. It is usual to allow a live load of 5cwts. per ft. super. in addition to the dead load of structure and road material, if traction engines are to be provided for. In short-span bridges it is also necessary to allow for a concentrated load in the centre equal to the load of one wheel of the traction engine upon a trough, say, 4 tons. Assuming a mean depth of road material of 15ins., the dead load would be about $1\frac{1}{2}$ cwts. per sq. ft. This would give a bending moment of

$$\frac{wl^2}{8} = \frac{\frac{5+1\frac{1}{2}}{20} \times 8^2 \times 12}{8} = 31{\cdot}2 \text{ ton-ins.};$$

or allowing for a concentrated load

$$\frac{wl^2}{8} + \frac{wl}{4} = \frac{\frac{1\frac{1}{2}}{20} \times 8^2 \times 12}{8} + \frac{4 \times 8 \times 12}{4}$$

$= 7{\cdot}2 + 96 = 103{\cdot}2$ ton-ins. This is much the more serious, as often happens with short spans. Dorman, Long & Co.'s section "B Maximum" has a moment of resistance of 113.75 ton-inches, and would be a suitable one to adopt.

HENRY ADAMS.

Rights of Adjoining Owners.

G. writes: "A and B are neighbours. A owns a one-storey span-roofed building with chimney flue and skylight, which has been in its present position and has enjoyed its present privileges for 20 years. B has just erected a three-storey building around A's building, and he states that the smoke from A's chimney discolours and damages his brickwork, and he claims that A should carry his stack and head above his (B's) building. A states that B's building has caused a serious downdraught to his flue, and claims that B should carry up the flue at his own expense to remedy the defect. Please state (1) the rights of each, saying whether there is any definite law or any previous case on the point; (2) whether A has acquired ancient lights for his skylight, and if so, at what angle his light area should be measured."

(1) By the Prescription Act (2 and 3 William IV., c. 71) twenty years' enjoyment of light to the skylight, and of air to the chimney, has given A the right to continue to so enjoy them. B has violated these rights and should be prepared to indemnify A accordingly. The law is very clear upon the subject (refer to the subject of "Easements" in any legal treatise) and only becomes doubtful when the actual measure of damages is to be ascertained. There are hundreds of decided cases upon the subject. (2) There is no fixed angle for light area, though 45 degs. has been mentioned in this connection. The legal question is, has A's light been substantially diminished? F. S. I.

THE ARCHITECTURAL ASSOCIATION.

The London Architect's difficulties.

A meeting of the Architectural Association was held on Friday evening at 18, Tufton Street, Westminster, the chair being occupied by Mr. Walter Cave, vice-president.

Mr. Cave announced that Mrs. Garner had made a present to the Association of 200 volumes from the library of her late husband, Mr. Thomas Garner. This announcement was received with much applause, and Mr. E. P. Warren spoke at some length on the abilities of the late Mr. Garner and the work he had done, both individually and in conjunction with Mr. G. F. Bodley.

A presentation

was then made to Mr. W. G. B. Lewis, who has done so much for the A.A. Day School. The presentation took the form of Mr. Gotch's fine book on "The Architecture of the Renaissance in England," together with a cheque for £50. Appreciation of the services rendered by Mr. Lewis was expressed by Mr. Walter Millard and Mr. G. H. Fellowes Prynne.

Mr. William Woodward, F.R.I.B.A., then read a paper on "The Difficulties which Beset an Architect in London, with Special Regard to Existing Legislation and other Controlling Authorities."

Mr. Woodward observed at the outset that if every architect or building owner were permitted to exercise his own free will, London would assume a picturesqueness, to say the least, which would be instructive, if not satisfactory. But the present question was not so much the non-necessity of control as the manner in which it was administered. Looking back, say, 40 years, it was startling to notice the difference in the way in which building works were permitted to be carried on.

A grandmotherly legislation

had sprung up, and was increasing every day, with the apparent object of stifling all individuality, and bringing everybody within a code of Acts of Parliament, rules, regulations and by-laws, most of them the result of officialism and red tape, and many of them the result of inadequate knowledge.

The architect who had to erect a building in London was pulled up at every stage by the London County Council, borough councils, medical officers of health, sanitary inspectors, district surveyors, surveyors to freeholders, litigants in "light" cases, party-wall awards, and sometimes, to add to his miseries, an interfering and objectionable client.

Moreover, many of the controlling bodies took upon themselves responsibilities which were quite unnecessary. The County Council, for example, forgot to say, in the case of covered ways and projecting iron and glass shelters, &c., that its duty was merely in regard to projection beyond the line of frontage. Having found that there was no objection to such covered ways, it might well leave the safe construction of the work to the architect and building owner; but, instead of that, it employed a staff of gentlemen to examine into every minute detail of construction, and thereby, of course, in the case of any failure, held itself responsible for the results.

Again, the borough councils were often far too particular about the works which came under their control. The architect had to meet the fads and fancies of medical officers of health and sanitary inspectors, and recently an enormous amount of unnecessary work had been placed upon the architect's shoulders in preparing plans and sections of water-closets, &c., which a practical-minded surveyor could settle in five minutes, without any such drawings.

At this juncture Mr. Woodward took occasion to say

something about district surveyors.

The architect had been made painfully aware of the different way in which the provisions of the Building Act were administered by different district surveyors: in some cases the whole intention of the Building Act being maintained, and the public interest looked after, without causing any friction with the architect, while, in other cases, a policy of pin-pricks and unnecessary interferences was carried on by straining to its utmost extent every section in the Building Act: and where one section did not apparently give sufficient elasticity for bothering the architect and the builder the district surveyor would sift out some other clause better enabling him to pursue his worrying tactics.

Surveyors to freeholders also took upon themselves responsibilities for construction, &c., which they were not bound in any way to assume, and by this means drove the architect to desperation by interferences in minor and trifling matters of detail which in no way concerned the reversion at the end of 80 years.

"Now," said Mr. Woodward, "let us assume that, after many months of patient endeavours on the part of the architect, the production of dozens of unnecessary drawings, and the consumption of an enormous amount of unnecessary time with all the varied bodies, in simply obtaining official sanction to what is proposed. The building starts, and almost before the demolition of the old premises is completed, down comes

a little army of adjoining owners,

with purely imaginary grievances as regards interference with 'light'; and, after obtaining injunctions, which stop all building works, the case is fought out in the Law Courts with two or three eminent surveyors on one side who swear that, if the building goes up as designed, the owner of the dominant tenement may as well go and drown himself at once, as he can only die a lingering death in consequence of being closed in in tomb-like fashion, deprived of every particle of 'light' and every particle of air that is so necessary to sustain life in London; and on the other side, three equally eminent surveyors will swear that the erection of the new building will not only not interfere with the 'light' hitherto enjoyed by the dominant owner, but his 'light' will be very materially improved by the erection of a building double the height of the old building pulled down.

"We all know the building hasn't gone so far without being the subject of sometimes

several party-wall awards

and in the communications between architect and architect as regards these party-wall awards, considerable experience is gained as to the real knowledge of architects, and their propensities to adopt the methods of the lawyer in arriving at a conclusion on very simple practical matters; and the architect to the building owner also discovers how varied the ideas of the architect to the adjoining owner are in the matter of fees. I have myself had instances where, with precisely the same award, which I have myself drafted, and with precisely the same work on the part of the adjoining owner's surveyors, in connection with the same building, the fees have ranged from 2 guineas to 25 guineas; and may I make an observation upon the

additional unnecessary trouble and expense

incurred in stamping the awards and counterparts. Personally, I never require this stamping to be done. It is true it only costs £2, but what I complain of is the unnecessary trouble and time which it involves."

Some practical suggestions

were made by Mr. Woodward. First, he suggested that the Building Act Committee should be abolished, or reduced to, say, 4 members, selected specially for their knowledge of building operations, and for their non-political tendencies. Then, in regard to the clauses in the new Building Act respecting risks from fire, there could be no doubt the L.C.C. was unnecessarily worrying, simply because an unfortunate fire occurred in Queen Victoria Street, which entailed a loss of life, for which the London Fire Brigade were not wholly irresponsible. The L.C.C. requirements about lobbies, ventilating trunks, and other absolutely unnecessary and untried ideas were the source of a large expenditure of money and serious interference with the building, and Mr. Woodward felt quite sure that, if the architects were left to themselves to provide reasonable means of escape in case of fire, far better results would be obtained.

The setting back of the building line at the rear of certain buildings, and the angle of 63½ degs., was

a monstrous interference

with the disposition of property. The control exercised by the L.C.C. over simple projections at the rear, or porticos and covered ways in the front of buildings should be shifted from that central body to the surveyors and councils of the respective local boroughs, who were far better able to judge the effect of such additions than the central body, who could know very little indeed of the local requirements of such a vast area as London.

The L.C.C. requirements as to theatres

were quite excessive. Everyone agreed that proper means of rapid exit should be provided. The Council, however, did not stop there, but must needs grope about after gas taps and the opening of doors in certain directions, which would probably be more mischievous in case of fire than if the old doors were left alone. Certain staircases, in the eyes of the Council, were safe if they had a certain tread and rise, and a certain number of steps in a flight, and absolutely unsafe if half an inch or so were taken from the tread or added to the rise. But why an additional step or two should make the building unsafe only the L.C.C. could say.

Building Agreements.

Then, again, the L.C.C. building agreements for letting land were too much on one side. The conditions in the building agreements of the great ground-landlords of London were sufficiently stringent; but the L.C.C. requirements were such that every building owner, with due regard to his financial prospects, would hesitate before binding himself to them.

So far as the district surveyors were concerned, Mr. Woodward said he would frame another Building Act, limiting their jurisdiction very much indeed, and only securing that the building should have its walls and floors of a substantial character; while, as to rights of "light," he would prevent any question on that subject being brought before learned judges in the High Court who had never seen the buildings in question, and who were quite unable to understand the effect of a new building upon the "light" of the dominant owner—such matters should be left to the decision of a tribunal of experts, similar to that under the Building Act of 1894.

In regard to surveyors to ground-landlords, Mr. Woodward said it would be well if some case of unnecessary interference and unwarranted straining of the building agreement clauses were fought out in a court of law. We should all then know better "where we are."

London 40 Years Ago.

"I am not aware," Mr. Woodward continued, "in looking back 40 years, that London was a very much worse place then, under the Metropolitan Board of Works and under the old vestries, than it is now, under the swelled body at Spring Gardens, and under the equally swelled bodies called borough councils. Regard for open spaces was secured by the then Lord Brabazon (now the Earl of Meath), the Chairman of the Metropolitan Gardens Association; and although the L.C.C. takes credit for maintenance as open spaces what would otherwise have been built upon, much of that for which they take credit is due to the Association I have referred to; in fact, I was myself, as honorary architect to that Association, the principal mover in preventing the L.C.C. building upon the triangular plot at the junction of Oxford Street and Bloomsbury Street; and equally in preventing the erection of a block of buildings, projected by the L.C.C., right in the centre of Piccadilly Circus."

In all these matters Mr. Woodward saw a growing consumption of red tape and officialism—ink and paper instead of the sound practical knowledge which existed 30 or 40 years ago. "Large building speculators are shutting up their pockets and thereby adding to the long list of unemployed in the building trade, simply because they will not submit to the delays, petty interferences, and results of inadequate knowledge forced upon them by various bodies. Surely some credit should be given to architects of repute and experience for knowing nearly as much about healthy and sound construction of a building as

an assembly of greengrocers and cheesemongers

or perhaps youthful scholars who come from technical schools, armed only with superficial knowledge, without any experience in active building operations, but who are led away by the crude ideas of faddy councillors who do no good whatever to buildings in course of erection, but, on the contrary, manage to make them inconvenient inside, and mutilate them outside."

Absurdities in the Country.

Going from London to the provinces, Mr. Woodward said they all knew what wretched results had arisen from the interferences of the Local Government Board in building operations, especially in cottages. "We all remember the picturesque cottages throughout the Kingdom, which have lasted for two or three centuries, which are generally composed of wood, with thin party divisions and picturesque tile roofs and half-timber exteriors, and that they have not led to any considerable loss of life from fire; I believe that the only few losses of life through fire in these cottages throughout the Kingdom has been the result of inebriety on the part of the occupiers; the Local Government Board, however, must needs try to apply to these country cottages the impossible provisions of the London Building Act, with brick external walls, the absurd carrying-up of party walls above the roof, and other perfectly ridiculous requirements which have done so much to stop the building of country cottages."

Discussion.

Mr. Douglass Mathews, in passing a vote of thanks to Mr. Woodward, referred to the fact that the district surveyors of London were an independent authority, and had been in existence for 250 years, and he thought it would be very regrettable if they became officials of the London County Council. With reference to Mr. Woodward's remarks about right-of-light cases, he referred to the Bill which had been drawn up by representatives of the Royal Institute of British Architects and the Surveyors' Institution, and placed before Parliament, which he thought would overcome many of the troubles at present existing.

Mr. George Hubbard seconded the vote of thanks. After giving some instances of absurd decisions by various authorities, he referred to the fact that in America no rights of light existed, but each building owner had to give attention to obtaining light from his own land. He thought the English system was distinctly unfair to adjoining owners.

After some remarks by Mr. Henry Lovegrove, Mr. C. H. Brodie proposed the following resolution:—"That this meeting of the Architectural Association, having listened to a paper on 'The Difficulties which beset an Architect in London,' and a discussion thereon, declares its conviction that the ratepayers of the Metropolis are put to a large amount of unnecessary trouble and expense by the excessive, and often absurd, requirements of the various authorities having control over building and sanitary works." This was seconded by Mr. Woodward, and carried *nem. con.*

Mr. Bernard Dicksee expressed his belief in the advisability of an appeal from all decisions of administrative bodies as a wholesome corrective.

With some final remarks from Mr. Saxon Snell and the chairman, and a reply by Mr. Woodward, the meeting terminated.

The new Cotton Exchange at Liverpool was opened by the Prince and Princess of Wales on Friday last. The building is in Old Hall Street, and, inclusive of site, has cost about £300,000. Messrs. Matear and Simon were the architects, their work being carried out with great expedition by The Waring White Building Co., Ltd., of London.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, *Great New Street, Fetter Lane, E.C.*

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Barnsley.—For new sewage works, for the Corporation. Mr. J. H. Taylor, M.I.C.E., borough engineer:—

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Dec. 6. Derby.—*Erection of lavatory,* Locomotive Department, Derby, and extension of awning, &c., at Evesham Station, for the Directors of the Midland Railway. Plans and specifications may be seen, quantities and particulars obtained on application to the Company's Architect, Cavendish House, Derby; or at the Engineer's Office, Derby Station. Sealed tenders to be forwarded by post to the Secretary of the Way and Works Committee, Midland Railway, Derby, not later than 9 a.m. on Dec. 6.

Dec. 7. Sneinton.—*Alterations to the Boys' Swimming Baths* at the Victoria Baths, Sneinton. Plans may be seen, and copies of the specification, quantities, and form of tender obtained from F. B. Lewis, city architect, Guildhall, on payment of a deposit of £1 1s. Sealed tenders, properly endorsed, to be delivered to S. G. Johnson, town clerk, The Guildhall, Nottingham, not later than 10 a.m. on Dec. 7. Fair wages clause.

Dec. 8. Orrell.—*Erection of new offices* for the U.D.C. Builders desirous of tendering must send in their names to R. Pennington, architect, Malvern Chambers, Wigan, on or before Dec. 8. £2 2s. will be charged for bills of quantities.

Dec. 8. Maesteg.—*Rebuilding of Bethania Welsh Baptist Chapel,* Maesteg. Plans and specification can be seen with Rev. Iorwerth Jones, Bethania View, Maesteg, and at the office of W. Beddoe Rees, architect, 5, Dumfries Place, Cardiff, from whom bill of quantities may be obtained on deposit of £1 1s. Tenders to be sent to T. Rees, secretary, 16, Bank Street, Maesteg, on or before Dec. 8.

Dec. 8. Glasgow.—*(1) Excavating, &c., work;* (2) iron and timber gymnasium appliances; (3) iron fencing, and (4) caretaker's box and water closets in connection with the proposed playground for children in Barcaple Street, Springburn, for the Corporation. Specifications and forms of tender may be had on application at the Office of Public Works, 64, Cochrane Street. Sealed offers, marked outside "Offer for .... Children's Playground," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, on or before Dec. 8.

Dec. 10. Kingussie.—*Erection of new class rooms* at the Public School, Kingussie. Plans and specifications to be seen with A. Cattanach, architect, The Laurels, Kingussie, and offers will be received by L. Mackintosh, clerk to the School Board, till Dec. 10.

Dec. 12. Edinburgh, Glasgow and Aberdeen.—*Repairs to buildings* in charge of the Commissioners of H.M. Works and Public Buildings. Separate tenders are invited for the execution of—(1) Excavator's, mason's, and bricklayer's work; (2) carpenter's and joiner's work; (3) ironfounder's, smith's, and ironmonger's work; (4) slater's work; (5) plasterer's work; (6) plumber's and gasfitter's work; (7) painter's, paperhanger's, and gilder's work; (8) glazier's work; (9) blindmaker's and bellhanger's work, to buildings in (1) Edinburgh, (2) Glasgow, (3) Aberdeen, for three years from Jan. 1. The printed schedule, with form of tender, may be obtained on application to W. T. Oldrieve, H.M. Office of Works, Edinburgh, between 11 a.m. and 3 p.m., upon payment of 10s. for each schedule. Tenders must be delivered on or before Dec. 12, addressed to the Secretary, H.M. Office of Works, Storey's Gate, London, S.W., and endorsed "Tender for Ordinary Works and Repairs," (1) Edinburgh, (2) Glasgow, (3) Aberdeen, as the case may be.

Dec. 12. London, N.—*Extension of, and an additional storey* to, the laundry at the Edmonton Workhouse, at Upper Edmonton. Drawings and specifications of the proposed work may be seen at the offices of the architect, S. Hill, 106, Cannon Street, E.C., and bills of quantities had on payment of £5 5s. (cheque). Sealed tenders to be delivered to F. Shelton, clerk, Lower Tottenham, on or before 9 a.m. on Dec. 12.

Dec. 14. London, S.E.—*Enlargement of the sorting office* at Lewisham, S.E. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to J. Wager, H.M. Office of Works. Bills of quantities and forms of tender may be obtained of the Secretary, H.M. Office of Works on payment of £1 1s. Tenders must be delivered before 12 noon on Dec. 14, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed "Tender for Lewisham Sorting Office Enlargement."

Dec. 17. Hedon.—*Additions and alterations to* the Council School, Hedon. Plans and specifications may be seen, and forms of tender and copies and quantities obtained, on application to the Building Surveyor, County Hall, Beverley, upon depositing £1 1s. A copy of the plans and specification will be deposited at the Council School, Hedon, after the above date for the convenience of persons tendering. Tenders endorsed "Hedon Council School Extension" must reach J. Bickersteth, clerk to the East Riding Education Committee, County Hall, Beverley, on or before 10 a.m. on Dec. 17.

Dec. 17. New Shoreham.—*Alterations and additions* to the New Shoreham Council Schools Plans, specifications, and conditions of contract may be seen and forms of tender obtained at the offices of A. W. Nye, 2, Duke Street, Brighton. The contractor whose tender is accepted will be required to enter into a contract with the West Sussex and Chichester Local Education Authority, and, if required, to enter into a bond with two approved sureties for the due carrying out of the contract. Tenders, sealed and endorsed "Tender for Alterations and Additions to the New Shoreham Council Schools," to be addressed and delivered to L. Thompson, secretary, Education Offices, Horsham, not later than first post, Dec. 17.

Dec. 18. Durham.—*Additions to Croxdale Council School.* Plans, specifications, and conditions of contract may be seen of W. Rushworth, F.R.I.B.A., architect, County Education Offices, Shire Hall, Durham. Quantities may be obtained on application to the Architect, to whom sealed endorsed tenders must be delivered not later than Dec. 18.

Dec. 19. Bilston.—*Re-glazing, without putty, of portions* of the roof of their covered market hall, Church Street, Bilston, for the U.D.C. Persons tendering must state the system of glazing suggested, the period for which they will guarantee the work, and what security they offer in support of such guarantee. The roof may be inspected upon application to J. P. Wakeford, Assoc.M.Inst. C.E., engineer and surveyor, Town Hall, Bilston, and tenders, addressed to him, sealed and endorsed "Tender for Market Hall Roof," must be delivered before 12 noon on Dec. 19.

Dec. 25. Worcester.—*Erection of new warehouse* and offices for Kay's, Ltd. Builders desirous of tendering should apply to Simpson & Ayrton, architects, 3, Verulam Buildings, Gray's Inn, London, W.C., on or before Dec. 25. Quantities will be supplied, for which a deposit of £2 2s. will be charged.

Dec. 29. Carmarthen.—*Erection of new workhouse* at Carmarthen. Contractors desirous of tendering are requested to send in, not later than Dec. 8 next, their names and addresses to A. I. Jones, Board's architect, 2, Spilman Street, Carmarthen, together with a cheque for £2 2s. for bill of quantities. Sealed tenders (marked "New Workhouse") must be delivered to J. Saer, clerk to the Guardians, 7, Hall Street, Carmarthen, not later than Dec. 28. The tenders will be opened at the Board meeting on Dec. 29.

Jan. 17. London, S.E.—*Alterations and additions at the Infirmary,* Lower Road, Rotherhithe, S.E., according to plans and specification prepared by A. H. Newman, and quantities by W. T. Farthing & Son. Persons desirous of tendering for the works are required to send their names and addresses before Dec. 8 to E. P. Fenton, clerk to the Guardians, 283, Tooley Street, S.E., and to deposit with him a £50 Bank of England note. As soon after Dec. 8 as possible, forms of tender, bills of quantities, etc., and all other necessary information will be supplied to those persons whose names, addresses, and deposits have been supplied to the Clerk to the Guardians. The specification and plans of the works will then be open for inspection by such persons at the architect's offices, A. H. Newman, 31, Tooley Street, London Bridge, S.E., on production of the form of tender. Fair wages clause. Sealed tenders, endorsed "Tender for Alterations and Additions, Infirmary," must be delivered personally to E. P. Fenton, clerk, 283, Tooley Street, S.E., at 6 p.m. on Jan. 17, accompanied by the bills of quantities, &c., in a separate sealed envelope. The tenders will be opened and considered at 7 p.m. at the meeting of the Guardians on Jan. 17, at their Board Room, at which place, date, and time a responsible member of the firm tendering must be in attendance.

ENGINEERING.

Dec. 7. Portsmouth (Contract No. 12).—*Supply of steam, exhaust,* feed and circulating water-piping, for the Corporation. The specification and drawings, with general conditions and form of tender, can be obtained on application to A. Hellard, town clerk, Town Hall, Portsmouth, and a deposit of £2 2s. must accompany any such application. Any further particulars can be obtained on application to V. G. Lironi, M.I.M.E., A.M.I.E.E., tramways engineer, Engineer's Office, Vivash Road, Fratton, Portsmouth. Fair wages clause. Tenders must be delivered to the Town Clerk, Town Hall, Portsmouth, not later than 12 noon on Dec. 7.

Dec. 12. London, E.C.—*Supply and delivery of electric cranes,* &c., for the East Indian Railway Co., as per specification to be seen at the Company's offices. Tenders are to be sent to C. W. Young, secretary, Nicholas Lane, London, E.C., marked "Tender for Electric Cranes," not later than 12 noon on Dec. 12. For each specification a fee of £1 1s. is charged, which cannot under any circumstances be returned.

Dec. 12. London, N.E.—*Building in a Lancashire boiler,* &c., at the Workhouse, Sidney Road, Homerton, N.E. The boiler is already on the premises. Specification, conditions of contract form of tender, and order to view the site can be obtained of F. R. Coles, clerk to the Guardians, Clerk's Office, Hackney Union, Homerton, N.E., where also the plans (as prepared by L. J. Todd, consulting engineer, 25, Brooke Road, Stoke Newington, N.) may be inspected. The contractor will be required to give approved security for the due performance of the contract in a bond, the form of which may be seen at the Clerk's Office. Sealed tenders, endorsed "Building in Lancashire Boiler, &c.," must be delivered to F. R. Coles not later than 2 p.m. on Dec. 12.

Dec. 12. Cheddington.—*Supplying, carting, excavating* for, laying, and jointing of about 2,500 yds. of 4-in. and 3-in. cast-iron pipes and specials, including fixing valves, hydrants, &c., and constructing brick service reservoir, and all works in relation thereto, for the Cheddington water supply. Plans and specifications may be seen and copies of the quantities and forms of tender obtained from Sands & Walker, engineers, Milton Chambers, Nottingham, on payment of £2 2s. (by cheque). Sealed and endorsed tenders to be sent to Sands & Walker, Milton Chambers, Milton Street, Nottingham, on or before Dec. 12.

Dec. 12. Croydon.—*Supply of laundry machinery,* electric motors, wiring, &c., at the Croydon Mental Hospital, situated at Warlingham, Surrey. Plans and specifications may be seen on application at the office of the Borough Engineer, Town Hall, Croydon, and copies thereof and forms of tender may be obtained on receipt of a bona fide tender. Tenders on the prescribed form to be sent to F. C. Lloyd, clerk to the Visiting Committee, Town Hall, Croydon, by 11 on the forenoon of Dec. 12.

Dec. 13. Monaghan.—*Carrying out of the following works* at new building for the Joint Committee of the Monaghan Asylum:—(a) Internal plumbing work; (b) heating; (c) cooking apparatus; (d) gasfitting; (e) fire mains, in accordance with plans and specifications, which may be seen at the Boardroom of the Asylum between 10 a.m. and 5 p.m. on any week day. Tenders to be forwarded by registered post, endorsed "Tender for Plumbing Work, &c.," by Dec. 13. Tenders to state the names of two solvent securities, who will be prepared to enter into a bond conditioned for the due fulfilment and for the completion of the contract by such date as the Committee may determine.

Dec. 15. Handsworth.—*Supply, delivery and erection* of the following plant at their electric power station, for the U.D.C. Contract No. 15—Extension water-tube boilers (two); Contract No. 16—Extension engine (500 i.h.p.) and dynamos (one 315 kw. and two 45 kw.). Tenders will only be considered for the whole of the work covered by each specification, and not for any part thereof. Copies of the specifications, with the conditions of contract, &c., can be obtained from H. Ward, clerk, The Council House, Handsworth, near Birmingham, on payment of £3 3s. The specifications, conditions of contract and drawings, can be seen at (but not obtained from) the offices of the consulting engineers, Kennedy & Jenkin, 17, Victoria Street, Westminster, London, S.W. Tenders, on the prescribed form, in sealed envelopes, and endorsed on the outside "Electric Light and Power Supply Tender, Contract No. —," must be delivered to H. Ward, at the Council House, before noon on Dec. 15. Fair wages clause.

Dec. 17. Portsmouth.—*Construction and maintenance* of an overflow weir chamber on the existing main low-level sewer, an underground pumping station, and other works, for the Borough of Portsmouth. The specification, form of tender, and bill of quantities may be obtained from A. Hellard, town clerk, Town Hall, Portsmouth, on payment of a sum of £2 2s. The drawings may be seen, and further information obtained, upon application at the offices of Bramwell & Harris, 5, Great George Street, Westminster, S.W. Tenders under seal, and endorsed "Tenders for Works for the Prevention of Storm Water Flooding in the Low-lying area of Southsea, Contract No. 3," must be delivered to the Town Clerk at or before 12 on Dec. 17.

Dec. 17. Castleblayney.—*Construction of a storage reservoir,* filters and clear water tank, providing and laying cast-iron pipes, &c., for the U.D.C., according to plans and specifications prepared by F. Bergin, B.E., 36, Westmoreland Street, Dublin, which can be seen at the office of B. M'Ardle, clerk of Council, Courthouse, Castleblayney, during ordinary office hours. Tenders, accompanied by a schedule of prices, and containing the names and addresses of two solvent securities willing to join in a bond of £1,000, or a Guarantee Society bond for the same amount, for the due performance of the contract, will be received by the Clerk up to 12 noon on Dec. 17. Tenders should be addressed to the presiding Chairman and endorsed "Tender for Castleblayney Sewerage and Waterworks," and no tender will be considered which is not on the proper form, to be had from the Clerk for a payment of £1. As the Council have decided on joining the schemes in one contract, the aggregate amount in tender for sewerage and waterworks will be the deciding price.

Jan. 1. Bray, Ireland.—*Supplying and erection of a high-tension* switchboard and instruments. Specification and form of tender may be obtained from W. J. U. Sowter, A.M.I.E.E., electrical engineer to the Council, on payment of a deposit of £2 2s. Tenders, sealed and endorsed "Switchgear," to be delivered to P. MacDonnell, clerk to the Council, Town Hall, Bray, Ireland, not later than 10 a.m. on Jan 1.

No date. Swansea.—*Construction and erection of two swing bridges,* one over the entrance lock to the King's Dock, and the other over the communication passage with the Prince of Wales' Dock, together with hydraulic machinery for working the same, for the Swansea Harbour Trust. Specifications and plans and forms of, and instructions for, tender can be obtained on application to T. Strick, clerk, Harbour Offices, Swansea, on payment of £5 5s.

IRON AND STEEL.

Dec. 7. Portsmouth.—*(1) To provide and fix a new iron fence* with gates around two pieces of land at the Circle, Clarendon Road, Southsea, in the Borough of Portsmouth. (2) To construct, complete and maintain in thorough repair a ladies' chalet at the Circle, Clarendon Road, for six calendar months from the completion of the whole. The specification and plan may be seen, and a form of tender obtained for each of the works at the Borough Engineer's Office at the Town Hall. The form of tender for each is to be completely filled in and sent under cover to reach A. Hellard, town clerk, Town Hall, Portsmouth, not later than 10 a.m. on Dec. 7.

Dec. 12. Durban, Natal.—*Supply and delivery* "free on board" of No. 18 iron window frames, size 10ft. by 5ft., for the Tramway Car-Shed. Specifications and drawing can be obtained from W. H. Radford, C.E. (consulting and representative engineer to the Corporation), Albion Chambers, Nottingham. Sealed and endorsed tenders must be delivered to Webster, Steel & Co., agents to the Durban Corporation, 5, East India Avenue, Leadenhall Street, London, E.C., on or before Dec. 12.

Dec. 19. Watford.—*Supply of a quantity of vertically cast-iron pipes* of various diameters for water mains at Nascote House Estate, together with all the necessary fittings, for the U.D.C., in accordance with printed specification and tender forms, which can be obtained at the Engineer's Office. Sealed tenders to be sent to the Offices of the Council, 14, High Street, Watford, addressed to H. M. Turner, and endorsed "Tender for Water-Mains," on or before Dec. 19.

PAINTING AND PLUMBING.

Dec. 6. Warrington.—*Painting of the new extensions* at the Police Buildings. Specifications and all further information may be obtained at the Office of the Borough Surveyor, Town Hall, at which place tenders must be delivered before 12 on Dec. 6.

Dec. 10. Newport, Mon.—*Painting and colouring* at the Blaina Central Council School and at the Garnvach Council School. Specifications may be seen of C. Dauncey, clerk to the Nantyglo and Blaina Group, County Council Offices, Newport, Mon., or at the Schools. Sealed tenders, endorsed respectively "Painting Tender, Blaina School," and "Painting Tender, Garnvach School," are to be in the hands of C. Dauncey not later than Dec. 10.

ROADS AND CARTAGE.

Dec. 5. London, N.—*Making-up of the following streets,* for the Wood Green U.D.C. :—(1) Braemar Avenue; (2) Eldon Road (Section 2); (3) Homecroft Road (East of Eldon Road); (4) Norman Avenue (East of Eldon Road), and (5) Grainger Road, all within the said Urban District. The plans, sections, and specifications may be seen, and bills of quantities obtained on application to C. J Gunyon, A.M.I.C.E., surveyor, at the Offices of the Council, Town Hall, Wood Green, upon payment of a deposit of £1 1s. Sealed tenders, upon the forms supplied only, to be delivered to W. P. Harding, clerk of the Council, Town Hall, Wood Green, N., not later than 5 p.m. on Dec. 5. Fair wages clause.

Dec. 6. London, S.W.—*Repairing and dressing the tar paving,* &c., at the Infirmary, situate St. John's Hill, S.W., for the Guardians of the Wandsworth Union. Form of tender and specification may be obtained upon application to F. W Piper, clerk, Union Offices, St. John's Hill, Wandsworth, S.W., and the same must be returned not later than 10 a.m. on Dec. 6.

Dec. 7. Kesteven, Lincs.—*Supply of broken granite, slag,* and slag dust for the main roads for the year 1907-1908, for the C.C. Forms of tender may be obtained from W. B. Purser, Assoc M.Inst.C.E., County Surveyor's Office, Grantham, to whom tenders, endorsed "Tenders for Materials," together with samples, must be delivered on or before Dec. 7.

Dec. 7. Richmond, Surrey.—*Levelling, metalling, paving and making good* North Road, Dancer Road, Darell Road and Chiltern Road (part of). Drawings and conditions of contract may be seen, and all particulars obtained, on application to J. H. Brierley, borough surveyor, Town Hall, Richmond, Surrey, where also a form of tender, together with schedule, and a copy of the specification obtained on payment of a deposit of £1 1s. No tender will be considered unless it is properly filled up and received within the time limited, and no expense in connection therewith will be paid to any person submitting a tender. Sealed tenders, properly endorsed, must be delivered to F. B. Senior, town clerk, at the Town Hall, Richmond, Surrey, on or before 4 on Dec. 7.

Dec. 10. London, S.E.—*Kerbing, channelling, foundations* for asphalt paving and road work in Elfindale Road, Herne Hill. Specification and form of tender can be obtained from W. Oxtoby, borough engineer, Town Hall, and tenders must be delivered on or before Dec. 10, not later than 6.30 p.m.

Dec. 10. Finchley.—*Supply of $\frac{1}{4}$-in. crushed shingle* for road gritting for the period ending March 31, 1907, for the U.D.C. The estimated amount required is from 200 to 600 tons. Sealed tenders, endorsed "Shingle," to be delivered to E. H. Lister, clerk to the Council, by 5 p.m. on Dec. 10.

Dec. 10. Hebburn.—*Excavating, bottoming, macadamising, channelling,* &c., in South Street, Hebburn, for the U.D.C. Plans, sections and specifications may be seen, and quantities obtained on application to H. Paterson, surveyor, at the Council Offices, Argyle Street, Hebburn. Tenders, endorsed "New Street," and addressed to the Chairman of the Building, Sanitary, and Nuisance Committee, to be delivered at the Council Offices, not later than noon on Dec. 10.

Dec. 12. London, W.—*Making-up and paving* Larden Road (part of). Plans and specification may be seen, and form of tender obtained, on application to H. Mair, borough surveyor. Sealed tenders, endorsed "Tender for Paving Work," must be delivered to H. Thompson, town clerk, Town Hall, Broadway, Hammersmith, not later than 6 p.m. on Dec. 12.

SANITARY.

Dec. 7. Richmond, Surrey.—*Construction* of about 66yds. 1in. of 12-in. surface-water sewer under the railway embankment at Kew, for the T.C. Drawings and conditions of contract may be seen, and all particulars obtained, on application to J. H. Brierley, borough surveyor, Town Hall, Richmond, Surrey, where a form of tender, together with a copy of the specification and bill of quantities, may be obtained on payment of a deposit of £1 1s. No tender will be considered unless it is properly filled up and received within the time limited, and no expense in connection therewith will be paid to any person submitting a tender. Sealed tenders, properly endorsed, must be delivered to F. B. Senior, town clerk, at the Town Hall, Richmond, Surrey, on or before 4 on Dec. 7.

Dec. 8. Swinton.—*Supply of sludge pump* at Swinton Sewage Works, for the Swinton and Pendlebury U.D.C. Particulars and form of tender can be obtained on application to H. Entwisle, Council Offices, Swinton, near Manchester. Sealed tenders to be returned, endorsed "Tender for Pump," to W. T. Postlethwaite, clerk to the Council, Council Offices, Swinton, not later than Dec. 8.

Dec. 14. Bushbury.—*Supply and laying of about 1,190yds.* of 12-in., 2,030yds. of 9-in., and 650yds. of 6-in. stoneware pipe sewers, together with the construction of all manholes, lampholes, and flushing chambers required, also for the construction of sewage-disposal works, including detritus and septic tanks and three circular filters and appurtenances, for the Bushbury (Oxley District) sewerage and sewage disposal. Plans may be seen, and specifications, bills of quantities, and form of tender may be obtained, on application to the Engineer to the Council, H. M. Whitehead, Engineer's Office, Penkridge, Stafford, upon payment of £5 Bank of England note. Sealed tenders, on the forms supplied, endorsed "Bushbury Sewerage," must be delivered to A. W. Carver, clerk to the Council, Union Offices, Cannock, not later than 10 on Dec. 14.

Dec. 19. Herne Bay.—*Construction of about $3\frac{3}{4}$ miles of brick and concrete* and pipe sewers, with all the necessary manholes, ventilators, and flushing arrangements, the construction of a pumping station, cottage, and buildings, and the provision of pumping machinery, for the U.D.C. Plans and specification of the works may be seen and the form of tender obtained at the office of B. Latham, M.Inst.C.E., Parliament Mansions, Victoria Street, Westminster, the engineer for the works, or at the office of F. W. J. Palmer, the surveyor to the Council, at his office at Herne Bay. The quantities of the several works have been taken out by C. E. Bruges, A.M.I.C.E., 1, Victoria Street, Westminster, and may be had on application either to the Engineer or Surveyor on deposit of £10. Sealed tenders, on the form supplied attached to the quantities, endorsed "Tender for Sewerage Works," are to be delivered to J. Jubb, clerk to the U.D.C., at Herne Bay, on or before noon on Dec. 19.

Dec. 19. Ware.—*Providing and laying* about 150yds. of 24-in. concrete tube storm-water drain and sundry other works in Star Street, Ware, for the U.D.C. The drawings and specification, with bill of quantities and form of contract, can be seen at the Office of the Council's Surveyor, H. F. Hill, New Road, Ware, between 10 a.m. and 4 p.m., and copies of the specification and forms of tender can be obtained on payment of £1 1s. Sealed tenders, endorsed "Star Street Drainage," are to be delivered to G. H. Gisby, clerk to the Council, Council Offices, Ware, not later than Dec. 19.

TIMBER.

Dec. 10. London, N.W.—*Supply of about 285,000 Jarrah blocks* in strict accordance with the conditions of the specification, for repaving Park Street, Camden Town, for the Highways, Sewers and Public Works Committee. Fair wages clause. No tender will be received unless made out on one of the official forms, which, with any further information, can be obtained on application to W. N. Blair, M.Inst.C.E., borough engineer and surveyor, up to noon on Dec. 10. Sealed tenders to be delivered, signed by the intending contractors, at the Offices of the Works Department (No. 4, First Floor) not later than 5 in the afternoon of Dec. 10.

MISCELLANEOUS.

Dec. 8. London, S.E.—*Supply of the following* for the House Committee of Guy's Hospital, for twelve months from Jan. 1, 1907 :—No. 1, Bricks, lime, and cement; No. 2, sand, ballast, and rubbish cartage; No. 3, sheet lead, pipes, &c.; No. 4, painter's materials. Further particulars, with forms of tender, may be obtained from the Superintendent. Tenders, duly sealed, should be sent in not later than 12 noon on Dec. 8.

Dec. 12. Dublin.—*Supply of the following articles,* from Jan. 1 to Dec. 31 :—Brass, gunmetal, &c., broken stone, cartage, foreign timber, iron castings, &c., ironmongery, &c., nails, &c., paints, oils, &c., paving setts and broken stones, planks and deals, steel and iron, white and red lead. Securities will be required. Preference will be given, after due regard to price and quality, to articles manufactured in Ireland. Sealed tenders, addressed to N. Proud, secretary, Port and Docks Office, Westmoreland Street, Dublin, and endorsed on the outside, "Tenders for ....," will be received up to Dec. 12. Forms of proposal may be had from the Secretary between 11 and 1.

Dec. 12. Macclesfield.—*Supply of drain pipes, castings,* cement, bricks, ironmongery, iron and steel, timber, hardwood, paints and oils, during the year ending Dec. 31, 1907, for the Corporation. Forms of tender can be obtained at the Borough Surveyor's Office. Fair wages clause. Tenders to be sent, addressed to the Chairman of the Highway Committee, Town Hall, not later than Dec. 12, marked outside "Tender for ...."

Dec. 13. Manchester.—*Supply and delivery* of the fireclay goods, for the Gas Committee, required during next season at their several gasworks. Full particulars and forms of tender may be obtained from C. Nickson, superintendent, at the Gas Offices, Town Hall, Manchester, on payment of a deposit of £2 2s. Sealed tenders, endorsed "Tender for Fireclay Goods," addressed to the Chairman of the Gas Committee, must be delivered at the Gas Offices, Town Hall, Manchester, on or before Dec. 13.

Dec. 13. Nottingham.—*Supply of the following stores* and materials, the contracts to commence on Jan. 1, and to terminate on Dec. 31, 1907 :—(1) Cement, (2) blue lias lime, (3) red bricks, (4) blue bricks, (5) timber, (6) earthenware pipes, &c., (8) iron castings, iron gulleys, &c., (9) Yorkshire flags, kerbs, &c., (10) granite setts, kerb and broken granite, (11) broken slag, chippings, &c., (12) river gravel. Forms of tender may be obtained by applying to A. Brown, M.Inst.C.E., city engineer, Nottingham, on payment of 5s. each. Patterns and samples may be inspected at the Eastcroft Depôt, London Road, Nottingham. The Committee will not consider any tender except those on the authorised form of tender, which must be sent to S. G. Johnson, town clerk, Guildhall, Nottingham, on or before Dec. 13. Fair wages clause.

TOO LATE FOR CLASSIFICATION.

Dec. 10. Leeds.—*Supply of the following* until March 31 :—Timber, ironmongery, plumbers' materials, builders' materials. Particulars, schedules and forms of tender may be obtained at the City Engineer's Office, on payment of a deposit of £1 1s. Tenders, properly endorsed, should be received at the City Engineer's Office, not later than 10 a.m. on Dec. 10.

Dec. 10. Nottingham.—*Erection of a bandstand* at the Arboretum, for the Public Parks Committee. Plans may be seen and copies of the bill of quantities and form of tender obtained from F. B, Lewis, city architect, Guildhall, on payment of a deposit of £1 1s. Sealed tenders, endorsed "Tender for Bandstand, Arboretum," to be delivered to S. G. Johnson, town clerk, Guildhall, Nottingham, at or before noon on Dec. 10. Fair wages clause.

Dec. 12. Hull.—*Erection of emigrants' room,* &c., Paragon Station, Hull, for the Directors of the North-Eastern Railway. Plans and specifications may be seen, and quantities and further information obtained on application to W. Bell, the Company's architect, at York; duplicate plans may also be seen at the Station Master's Office, Paragon Station, Hull. Quantities supplied on personal application to parties tendering for the whole of the work. Sealed tenders, marked "Emigrants' Room, &c., Hull," to be sent to the Secretary at York not later than noon on Dec. 12.

Dec. 15. Longton.—*Supply for twelve months ending Dec. 31, 1907, of the following:*—Broken granite and granite setts, Macclesfield setts, stone kerbs, cast-iron work, ironmongery, lime, Portland cement, blue paving bricks, earthenware pipes, wheelwright's work. Specifications and forms of tender may be had on application to J. W. Wardle, Assoc.M.Inst.C.E., borough surveyor, Court House, Longton, Satffordshire. Tenders under seal, endorsed "Tender for Granite, &c.," as the case may be, are to be left with him on or before Dec. 15.

Dec. 17. Flemington.—*Construction of a goods yard* and relative works at Flemington, Motherwell, for the Directors of the Caledonian Railway Co. Drawings may be seen at the office of the Company's Engineer, Buchanan Street Station, Glasgow, where copies of the specification and schedule may be obtained on payment of £2 2s. An asistant engineer will attend at Flemington Station on Thursday, Dec. 6, at 11 a.m., to accompany contractors over and point out the line of the works. Sealed tenders, endorsed "Tender for Flemington Goods Yard," to be lodged with J. Blackburn, secretary, Caledonian Railway Company's Offices, 302, Buchanan Street, Glasgow, on or before Dec. 17.

CONCRETE AND STEEL SUPPLEMENT (MONTHLY).

CONCRETE AGGREGATES.

By Thomas Potter.

(Concluded from page 80.)

Mr. Grant found that at the end of a year blocks of concrete made with one part of cement to six parts of Thames ballast broke under a compressive strain of 56 tons; one of blue lias lime and six of ballast, 6 tons.

The ratio of the increase in the strength of concrete can only be arrived at, so far as my knowledge goes, by a knowledge of the increase of the strength of cement, in the absence of any published records relative thereto. Mr. Grant made ten experiments with neat cement and ten with one of cement to one of sand, with the following result:—

Experiment No. 5.

Age.	Neat cement 2¼ sq. ins.	1 cement, 1 sand 2¼ sq. ins.
	lbs.	lbs.
7 days	817	353
3 months	1,055	547
6 do.	1,176	640
9 do.	1,219	692
12 do.	1,229	716
2 years	1,324	790
4 do.	1,312	818
6 do.	1,308	819
7 do.	1,327	863

But the ratio of increase in the strength of concrete may possibly be more correctly judged when the sand is in larger proportion to the cement. Mr. Grant made 960 experiments in the years 1862-3 with one part of cement to three parts of sand, the average result being:—

Experiment No. 6.

Age.	Per cent. of strength.
1 week	6.07
1 month	8.53
3 months	15.13
6 ,,	23.74
12 ,,	29.90

We may conclude from these and experiments of a similar character that Portland cement concrete at one month old does not approximately reach more than 33 per cent. of its ultimate strength, and at three months 50 per cent. The nature of the aggregates and the quality of the cement will obviously influence the result to a large extent, but the assumption is that both are of the best description.

At this point it may be well to call attention to

the floor and other tests

for concrete specified in many cases at the present time to be made at a month, when they are supposed not only to stand the maximum stress but a factor of safety in addition. It is a question whether many floors which have undergone this test have not been permanently weakened through over-strain. No floor should be tested under three months, and if it will stand the specified test then it will undoubtedly be 30 to 50 per cent. stronger in course of time, always assuming the best and proper materials are employed. The common assumption appears to be that concrete must possess a considerable margin of strength over and above all possible requirements, in case the strength might diminish hereafter; whereas—always again assuming that materials and workmanship are good—it is about the only material in a building that goes on increasing in strength for years.

Where a choice permits

it is worth noting that certain aggregates allow a smaller proportion of cement to be used therewith than others, without a corresponding diminution of strength, as Mr. Grant proved by the following experiment, in which the proportion was one of Portland cement to 10 parts of various aggregates, the blocks measuring 12-ins. cube, and tested at the end of a year:—

Experiment No. 7.

Crushed at tons.		Aggregates 10 to 1.
Air.	Water.	
48½	4	Ballast
50	68	Granite
53	75	Glass
60	52	Slag
72½	78	Portland Stone
70	98	Flints
90	100	Pottery

The result of this experiment proves that flints make concrete at one to ten nearly equal in strength to pottery, while glass is superior to slag.

These results are considerably at variance with experiments made with one of cement to six of an aggregate. The results of the above tests, which were the averages of a large number of experiments, somewhat upset previous experiments and all theory as to the strength of concrete made with different aggregates, for flint takes nearly the top place, Portland stone the third, and but little superior to glass, while Thames ballast comes last.

Non-absorbent Aggregates.

Flint surfaces are of a glassy, impervious nature, and this experiment (No. 7) tends to prove that aggregates of a non-absorbent character make better concrete when the proportion of cement is low than pervious ones. Flints, whether obtained from chalk strata or picked from the surface of agricultural lands having a chalk subsoil, should be washed and broken with a crusher—hand-breaking is quite useless for the purpose—and in this way an aggregate of a suitable nature and consistency is obtained without the admixture of any other materials; but the washing is better and more quickly performed after they are crushed, as the clay, marl, or chalk which adheres thereto is broken up into minute particles and much more readily got rid of, and the washing is more easily and economically performed on the mixing board, laid to a slight inclination, at the time the concrete is required. If the inclination is too great, the sandy element is carried away with the water; the boards should be adjusted to avoid this loss.

River gravel, when obtained from sluggish streams, has often fine muddy clay, washed in from the banks, attached thereto. This should also be eliminated by washing. Thames ballast is not always of one quality, as every London builder knows; it depends upon what part of the river it is obtained from.

Ashes and Breeze.

Ashes from locomotive and engine furnaces generally make excellent aggregates as before stated, if not intermixed with engine-room sweepings and coal dust, while coke breeze, whether of the ordinary kind or pan breeze, is scarcely inferior. The word "breeze" has been used to describe other materials beside coke residue—the screened ash-bin refuse of private houses and public buildings, for instance—so that a clear understanding is often necessary as to what the breeze is composed of, and the source from which it is obtained; the different descriptions of coal produce, too, very different qualities of coke breeze.

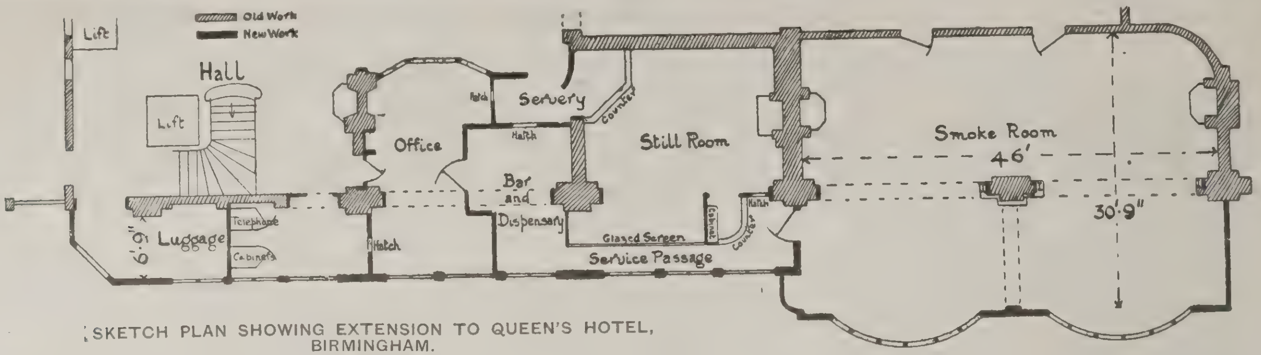
Old bricks

from buildings in course of demolition make good concrete if broken with a crusher, but not if hand-broken. They should be roughly cleared of old mortar—plastering mortar especially—while, if smoked and soot-laden, they should only be used in foundations. If used for walls, floors, or ceilings where the latter are formed by plastering direct on the concrete, stains will inevitably appear in course of time.

Old tiles, slates and similar materials are, as a rule, unfit for an aggregate; they are unshapable and impregnated with smoke and impurities.

Chalk

from the bottom stratum makes a fairly good aggregate; the upper or soft stratum is of too soft a nature, but I built cottages therewith many years ago, two storeys high, having concrete upper floors, the walls 12ins. thick, which are and have always been quite dry and left nothing to be desired. On one occasion I erected a specimen wall of soft chalk concrete, 4ft. in height and 9ins. in thickness, in the shape of a right angle on plan, measuring 5ft. each way, the concrete being one to seven. The chalk was screened through a 2-in. mesh sieve, and the portion that passed through a ⅜-in. mesh abstracted, and a coarse sand from crushed brickyard débris substituted. At the end of six months a chain was attached to one side at a point halfway in a straight line from the angle; a powerful cart horse was unable to pull it asunder. The weather had no effect upon it, although not cemented on the face or covered on the top, or otherwise protected, and after a year had elapsed it was broken down with sledge hammers. Blocks of chalk lying alongside were reduced to powder by the winter's frost, but blocks of chalk concrete were unaffected thereby. The cement appeared to have permeated the chalk and rendered it frost-proof. As an excellent material for building walls of military huts, &c., for the camp on Salisbury plain, chalk



SKETCH PLAN SHOWING EXTENSION TO QUEEN'S HOTEL, BIRMINGHAM.

was available everywhere in that district; walls could have been erected cheaply and by the military encamped there, and would have been warm and dry, instead of which cold and insanitary iron and match-boarded structures were erected in almost endless number.

Specifications often describe aggregates to be composed of different materials in certain proportions, such, for instance, as five parts of clinkers or broken-brick débris, and one part of sand or coke breeze; but the object is not clear. We seldom hear of cement mortar being made with cement and two different kinds of sand. In my experience the best aggregates are those in which the material is of one description throughout; if, however, Thames or other sand is added, through an insufficiency of the smaller element, that is a different matter, and cannot, perhaps, be avoided.

Many failures with concrete have taken place from causes unknown at the time it was used. Slag, unless it has been allowed time for æration by exposure to the atmosphere for a year at least to get rid of the sulphur contained therein, will disintegrate the concrete. Many failures have happened from using slag not sufficiently ærated, otherwise it is one of the best of aggregates.

Aggregates by rail have been conveyed in trucks previously used for the conveyance of lime, portions of which have got intermixed therewith, and, being unnoticed, have caused the concrete to blow or burst. This is not of frequent occurrence, but has happened. The aggregate should not be deposited near a lime shed, nor where plasterers are running lime for plastering, as pieces of unslaked lime or lime core screenings may inadvertently find their way among the concrete material. Numerous failures have occurred through pieces of lias limestone having passed through the furnaces of locomotives and mixed with the ashes which were afterwards used for making concrete. It is the practice on some lines of railways to give the drivers gratuities when the consumption of coal is below or not over the average, and where lines pass through lias limestone districts the drivers have found that lumps of limestone, when mixed with the coal, economise the latter. I have seen a large flight of concrete stairs and floors completely wrecked as a result.

DETAIL OF CANTILEVERS, QUEEN'S HOTEL, BIRMINGHAM.

Thames ballast and sand often contain pieces of **Coal** which may have been thrown overboard, or in some other way got mixed therewith. It used to be thought that the coal expanded and burst the concrete, but late trials do not confirm this view, although "blisters" in cement facing to walls have been traced to minute pieces of coal forming the cores thereof having burst the cement. This explanation of opposite results I am unable to give.

Obviously, aggregates for floors and walls—the former more especially—should be fire-resisting to a high degree, and the best fire-resisting aggregates have passed through fire or have withstood a great heat without disintegration, such as slag, furnace ashes, coke breeze, clinker, brick and tile yard débris, and burnt-clay ballast. Some of the floors tested for fire-resistance by the British Fire-Prevention Committee had Thames sand mixed with otherwise good fire-resisting materials. Thames sand, being the finer portion of flints formed by attrition, is a bad material to withstand fire, and the results were less successful than probably they otherwise would have been.

Captain Shaw, at one time Superintendant of the Metropolitan Fire Brigade, was in the habit of **cautioning firemen** from entering buildings on fire which had concrete floors made with Thames ballast and Thames sand. These were in the habit of collapsing when a fire occurred and without any warning.

The use and selection of aggregates for concrete purposes has too commonly been considered of small consequence, and that anything—clean or dirty—will answer the purpose equally as well, an idea which to some extent I formed myself very many years ago, but soon discovered that, like other things in life, we learn more from failure than from success.

NOVEL CANTILEVER CONSTRUCTION.

A great factor in travel is a good hotel at the end of the journey, and this the London and North-Western Railway has in Birmingham. The accommodation, however, until recently, was inadequate, and the Company some time ago decided upon extending the Queen's Hotel, which adjoins their well-known New Street Station. The extension was chiefly designed to enlarge the smoke-room, as it was felt that this room was insufficient for the hotel, in which general improvements in the service had lately been effected, resulting in the hotel being now one of the most favoured in the city. At the same time some of the service departments of the hotel also needed improving, and this has also been effected. The smoke-room and the service rooms in question abutted upon the station, from which light was obtained. The only way in which to secure the extensions, therefore, appeared to be to encroach upon the station, but the London and North-Western Railway estate department were debarred from obstructing the platform with columns in order to support the extension on the first floor (which constitutes the main floor of the hotel).

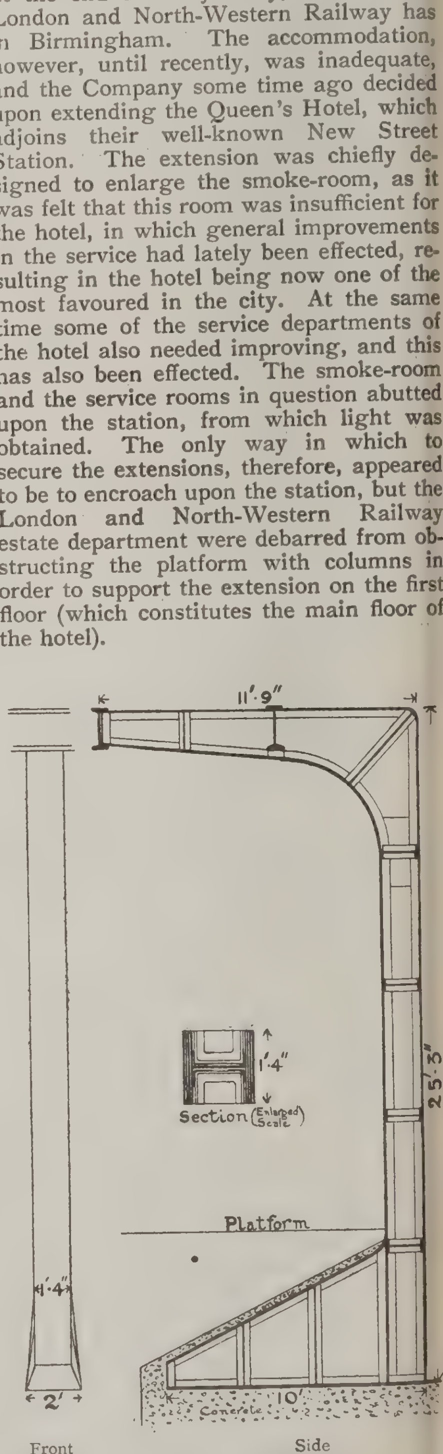


DIAGRAM OF CANTILEVER CONSTRUCTION, QUEEN'S HOTEL, BIRMINGHAM.

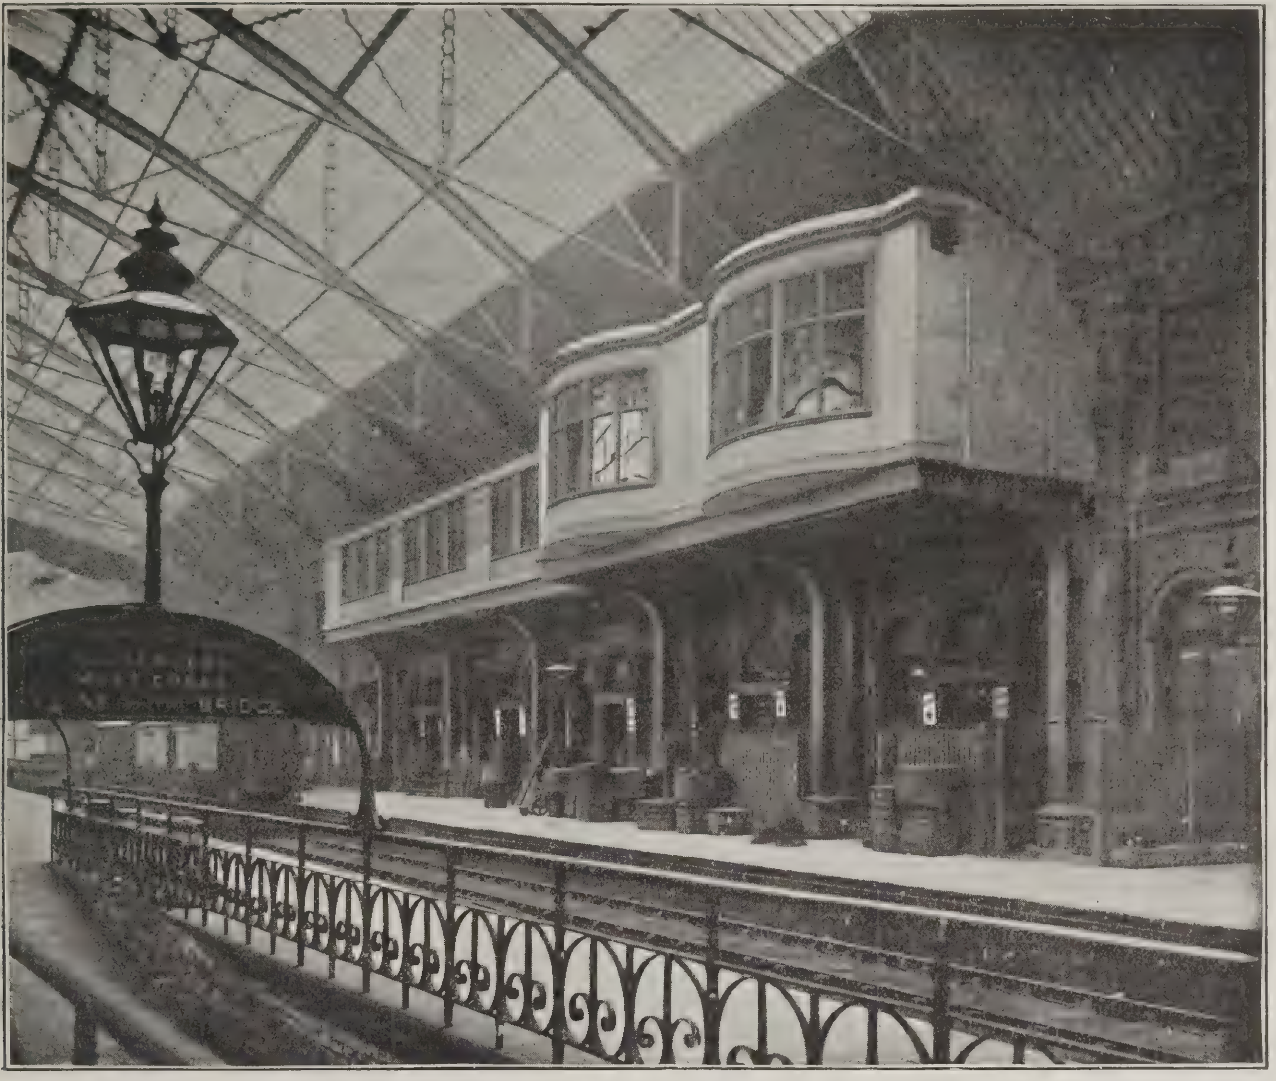


QUEEN'S HOTEL, BIRMINGHAM: GENERAL VIEW OF THE EXTENSION.

Whatever extension was to be done, therefore, must, on the one hand, not interrupt the clear space of the platform below, nor cut into the roof or prevent every part of the latter being open for inspection, re-painting and repair. The only way out of the difficulty clearly was to cantilever the extension over the platform. If, however, this were to be done by the usual method, not only would the interior of the hotel have to be seriously disturbed, but the conduct of the hotel would have been thrown out of gear for a considerable time and the disturbance would have resulted in considerable loss in custom. A way out of all the difficulties was eventually arrived at by the adoption of a novel form of cantilever construction. The cantilevers were built shaped like a bracket, thus], the details of which will be comprehended by inspection of the diagram and photographs which we publish. This job is the first occasion, so far as we know, where this form of cantilever has been adopted as a means of extending a building over a footway, and it offers an easy solution to a difficulty which is often experienced; by its adoption the interior of a building can practically be preserved against disturbance.

As will be gathered from the general photograph and from the sketch plan showing the alterations and extensions, the old front wall of the hotel was divided into bays by piers carrying the roof trusses. Each bay was sub-divided below by three arched openings, while above, on the first floor of the building, there were three openings in each bay having straight heads. The ground floor was occupied by cloak-rooms and other offices for the use of passengers and officials using the station, and the hotel was situated on the floor above.

The three openings between piers on the first floor were cut away in each of the four bays, as will be seen from the sketch plan, and three square steel frames were constructed to support the wall above by placing stanchions against the old piers riveted to joists below and joists above. These openings were closed with wood boarding practically without encroaching upon the existing space, so that the rooms could be used by the visitors and by the hotel officials without further disturbance, while the greater amount of the work was in progress.

Excavations were then dug in the platform to allow the cantilevers to be placed in position and concrete foundations to be constructed. The cantilevers being then placed upon their concrete foundations were themselves embedded in concrete below the platform level. The base of each cantilever was widened out to 2ft. so as to secure a wider bearing upon these foundations, and to increase its stability. 1¼-in. bolts, 3ft. 6ins. long, were also embedded in the concrete foundations and bolted to the feet of the cantilevers, so as to assist in securing them, while the cantilevers were also bolted through the existing piers, so as to assist in preventing any possibility of lateral movement. The larger cantilevers supporting the smoke-room extension are three in number and project 11ft. 9ins., allowing the construction of a room projecting over the platform to the extent of 16ft. The three smaller cantilevers had only 7ft. projection. The feet of the larger cantilevers project 10ft. and the smaller cantilevers 7ft. under the platform. As will be seen from the diagram the cantilevers are 25ft. 3ins. high above the foundations, and the upright stanchion portions are 1ft. 8ins. by 1ft. 4ins. The three larger cantilevers had this stanchion portion built up of a ¾-in. web plate riveted to four 4-in. by 4-in. by ½-in. angles, which are again riveted to the flanges, each of which is composed of four ½-in. plates. The flanges of the stanchion portions of the smaller cantilevers are much lighter, being composed each of two ⅜-in. plates. The cantilevers, as will be seen, have stiffeners at various points. The heads of the larger cantilevers have riveted at their outer ends, 6ft. 6ins. from the face, or 5ft. 3ins. from the back of this portion of the cantilever, an 18-in. by 7-in. by 75-lb. rolled steel joist, which serves to carry the front wall and projecting bow windows of the smoke-room extension. An intermediate rolled steel joist (of same size) runs parallel with the front joist and in order to support the small 6-in. by 3-in. by 12-lb. rolled steel joists of the concrete floor of the extension. The smaller cantilevers supporting the extension of the service portion carry only one 18-in. by 7-in. rolled steel joist—namely, at their outer extremities.

As regards the construction of the smoke-room walls, &c., light iron stanchions composed of 7-in. by 3¾-in. by 18-lb. rolled steel joists are erected at the corners, while in the centre between the two bow windows two joists on end, of the same size, are placed side by side. At the points where the bow windows begin two tee irons are placed back to back, and single tee irons are erected in between. These tee-iron and steel-joist stanchions are connected at their feet by 2-in. by ⅜-in. bars placed on edge and riveted to the tee iron stanchions. 2ft. 6ins. higher up similar bars connect the stanchions, and light tee irons measuring 2ins. by 2ins. by ¼in., are riveted between these bars. Similar framing is adopted in the portion of the walls above the glazing of the windows. These various members serve to reinforce the walls, which are constructed of breeze concrete proportioned 1 to 4. A similar construction was also adopted in the service portion for the reinforcement of the walls, which are likewise constructed of breeze concrete. The whole of the walls are 5ins. thick.

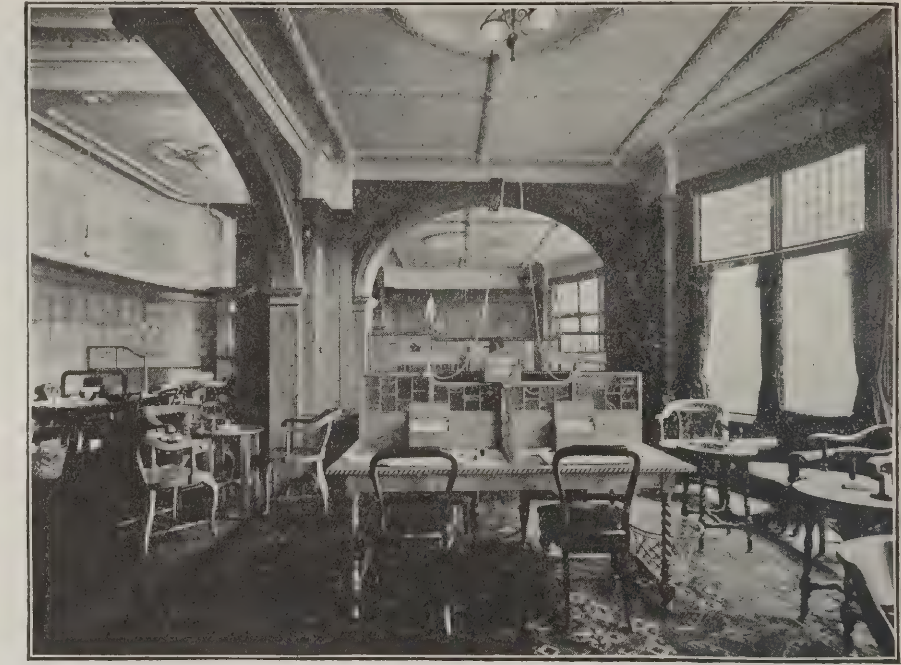
Joists embedded in the concrete floor are anchored down into the walls by means of bolts 15ins. long, so as to provide additional resistance to leverage, and the roof is also tied into the walls.

The interior of the smoke-room has been decorated in fumigated oak with ebony and pewter inlay by Messrs. Warings, Ltd. A deep frieze surrounds the old portion of the smoke-room, which is from 16ft. to 17ft. high, and the ceilings have also been richly decorated, as will be seen from the photograph of the interior which we give. The extended portion of the smoke-room, and also of the corridor, is only 12ft. high, it being impossible to go higher in consequence of the position of the station roof.

The arch shown in the centre of the photograph of the interior of the smoke-room was adopted as a means of decoratively treating the tie-bar of one of the roof trusses which comes below the ceiling. The left-hand portion of this arch, therefore, is simply a boxing around this tie-rod, which is open for inspection and re-painting above. The flat arches between the old piers, shown end-on in the view, are decorative and not constructive, being employed to be in harmony with the treatment adopted to deal with the necessity of the tie-bar coming below the ceiling.

The whole of the extension work was carried out to the design and under the supervision of the Estate Department of the London and North-Western Railway, the steelwork being designed by the Engineering Department of the railway and constructed by Messrs. Jesse Tildesley, Ltd., of Crescent Works, Willenhall, while Mr. E. H. Thompson, of 110, Bradford Street, Birmingham, was the general contractor.

Reinforced Concrete in Frosty Weather.—An interesting experiment is to be tried in the construction of a reinforced concrete bridge at Saskatoon for the Canadian Pacific Railway. The work is to be executed through the winter. The danger from frost is to be avoided by heating the concrete and preventing the work being frozen while setting. The contract was decided at the end of November, and it is confidently expected that the bridge will be ready for use by May 1st next.



QUEEN'S HOTEL, BIRMINGHAM: THE NEW SMOKE-ROOM.

SAN FRANCISCO'S NEW BY-LAWS.

New by-laws have recently been ordained for San Francisco regulating the construction of the buildings which will be erected in that city, and the enlargement, alteration and maintainance of those which have escaped the earthquake and fire. These by-laws contain a number of clauses regulating reinforced concrete construction, which are of considerable importance as showing the latest views of American municipal authorities upon the subject. The by-laws will, no doubt, be consulted by the framers of by-laws in this country for this class of construction. Such by-laws are already urgently called for by the great strides which have been made of recent years in steel and concrete construction. The chief clauses referring to the subject are as follows :—

BY-LAWS REGARDING REINFORCED CONCRETE CONSTRUCTION.

Section 164.—All reinforced concrete shall be constructed in accordance with the following provisions :—

The term "reinforced concrete," as used in this ordinance, shall be understood to mean an approved concrete mixture reinforced by steel of any shape, so combined that the steel will take up the tensional strain, and assist in the resistance to shear.

Stress.

Section 165.—Reinforced concrete construction shall be of such nature that the stresses can be calculated according to the accepted formulas of modern concrete engineering practice.

Concrete—Mixing of ; Method of Testing.

Section 166.—The concrete shall be mixed in the proportions of not less than one of cement to six of aggregates, consisting of sand and gravel or broken stone of 1in. major dimensions. The proportions shall be such that the resistance of the concrete to crushing shall not be less than 2,000lbs. per sq. in. after hardening for twenty-eight days. The tests to determine this value shall be made by a competent engineer under the direction of the Board of Public Works. The concrete used in reinforced concrete construction shall be what is usually known as a wet mixture.

Steel.

Section 167.—All steel with an elastic limit exceeding 40,000lbs. shall have a mechanical bond with the concrete.

Method of Reinforcing.

Section 168.—All reinforcing steel shall be completely enclosed by the concrete, and such steel shall be nowhere nearer to the surface than one and one-half times the diameter of such reinforcing steel bar or rod or other shape, but never less than 1in. The steel in beams or girders shall be so disposed that there shall be not less than one and one-half times the thickness of the steel in concrete between the steel, and where the number of bars used cannot be placed in one plane they shall be placed in two or more planes.

Reinforced concrete shall be so designed that the stresses in concrete and the steel shall not exceed the following limits :—Extreme fibre stress on concrete in compression, 500lbs. per sq. in.; shearing stress in concrete, 75lbs. per sq. in.; concrete in direct compression, 450lbs. per sq. in.; concrete in spirally-wound columns, 700lbs. per sq. in.; tensile stress in steel, one-third of the elastic limit; shearing stress in steel, 10,000lbs. per sq. in.

The adhesion of concrete to steel shall be assumed to be 75lbs. per sq. in. of surface where bars are three-quarters of an inch or less in diameter, and proportionately less in bars of a diameter greater than three-quarters of an inch.

The ratio of the moduli of elasticity of concrete and steel shall be taken as 1 to 15.

The following assumption shall guide in the determination of the bending moments due to external forces :—Beams and girders shall be considered as simply supported at the ends, no allowance being made for continuous construction over supports. Floor plates, when constructed continuous and when provided with reinforcement at the top of plate over the supports, may be treated as continuous beams, the bending moment for uniformly distributed loads being taken as not less than W L divided by 12; the bending moment may be taken at W L divided by 20 in the case of square floor plates which are reinforced in both directions and supported on all sides. The floor plate to the extent of not more than five times its depth may be taken as part of that beam or girder in computing its moment of resistance and the beam and slab must be built at the same time as a unit.

W—the total load.

L—the distance between centres of support.

The moment of resistance of any reinforced concrete construction under transverse loads shall be determined by formulas based on the following assumptions :—

(*a*) The bond between the concrete and steel is sufficient to make the two materials act together as a homogeneous solid.

(*b*) The strain in any fibre is directly proportionate to the distance of that fibre from the neutral axis.

(*c*) The modulus of elasticity of the concrete remains constant within the limits of the working stresses fixed in this ordinance.

The dimension of such a beam or girder and its reinforcement shall be determined and fixed in such a way that the strength of the metal in tension shall measure the strength of the beam or girder. If the concrete in compression, including the allowable concrete in adjoining floor construction, does not afford sufficient strength for that purpose, the compression side of the beam or girder in question shall also be reinforced with metal.

All beams or girders shall be reinforced with metal if necessary for shear. Other reactions, if necessary, shall likewise be reinforced.

Neither the reinforcing metal nor the concrete shall be subjected to combined stresses so as to exceed in combination the stresses allowable separately.

Wherever possible, beams and girders and also their intermediate floor construction shall be made continuous. Reinforcing metal shall be used for that purpose in the top of all connecting members at the point of support, and it shall be sufficient both in section and length to prevent fracture at the point of support where the connecting members are carrying twice their calculated loads.

The reinforcing metal in the bottom of a floor slab may be deflected to the top of the slab along the line of support, or separate reinforcing material may be used for the reinforcement in the top of the slab. In either case, however, if a part of the slab is considered as a part of the beam or girder, the reinforcing material used in the slab must cross the full width, both of the beam or girder and the part of the slab so considered.

The centering for the beams and girders of a floor shall be constructed in conjunction with the centering for the floor slabs which they support, and no centering shall be removed until all parts of the finished floors are strong enough to support themselves and the loads that may come upon them during construction.

Shear : Reinforced Concrete.

Section 169.—Reinforced concrete construction shall be designed so that the shearing stresses, both vertical and horizontal, developed in any part of the construction, shall not exceed the safe working strength of the concrete as fixed in this ordinance, or a sufficient amount of steel shall be introduced in such a position that the deficiency in the resistance to shear is overcome. This reinforcement to be part of, or rigidly connected to, the main horizontal tension bars.

When the safe limit of adhesion between the concrete and steel is exceeded, some provision shall be made for transmitting the strength of the steel to the concrete.

Columns.

Section 170.—Reinforced concrete may be used for columns when the ratio of length to least side or diameter does not exceed 15. The reinforcing rods shall be tied together at intervals of not more than the least side or diameter of the column, or spirally-wound steel may be used. No column shall be built less than 10ins. diameter.

When vertical reinforcement is used in columns, such as rods, they shall have full perfect bearings at each joint, and such joints shall occur only at floors or other points of lateral support and a tight-fitting sleeve shall be provided at all joints of vertical reinforcing rods.

The concrete shall cover the reinforcing bars at all points at least one and one-half inch, and in calculating the strength of a reinforced concrete column this outside 1in. of concrete shall not be counted as a part of the section of a column.

The axes of several columns acting continuously through two or more storeys shall accurately coincide, and the construction shall make special provision to effect this result.

Wind Pressure.

Section 171.—In the case of buildings in which allowance must be made for wind pressure, as provided in this ordinance, the reinforcing rods of columns shall be connected by threading the rods and by threaded sleeve nuts, or threaded turnbuckles, or methods equally effective and satisfactory to the Board of Public Works.

Tests — To be Made by Contractor on Demand.

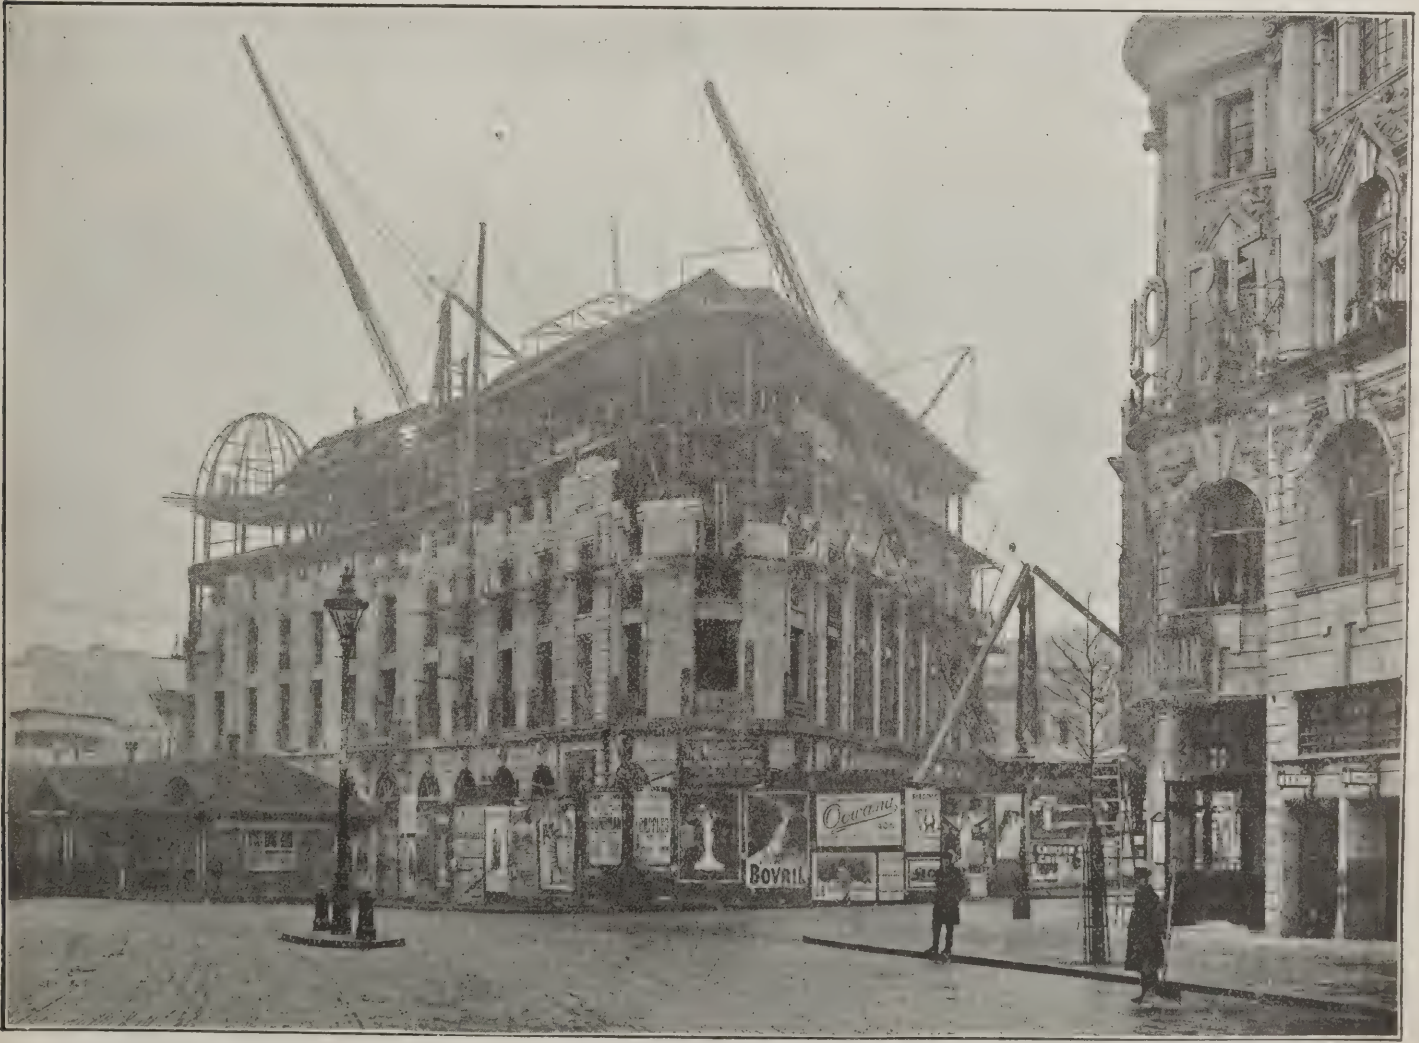
Section 172.—The contractor shall be prepared to make load tests on any portion of a reinforced concrete structure within a reasonable time after erection, as may be required by the Inspector of Buildings. Such tests shall show that the construction will sustain a load of twice that for which it is designed, without any sign of failure, or, in the case of beams, girders or floors, without deflecting more than one seven-hundredth of a span.

A Reinforced Concrete Floor Test.—Under this heading, on page 83 of the "Concrete and Steel Supplement" to our issue of November 7th, we published particulars of an interesting test recently made by Messrs. Potter & Co., Ltd., of 66 Victoria Street, S.W. We are now able to furnish some supplementary particulars. The materials used were ashes and clinker from boiler furnaces as received 5 parts, and Portland cement 1 part. The aggregate was carefully graded and the cement was of best quality. The reinforcement consisted of $\frac{1}{4}$ in. corrugated steel rods, distributed in a form supposed to give the best results. The chief object was to ascertain the resistance of the reinforcement to tensile and shearing strains. Ultimately the floor was loaded to about 3 cwts. per ft. super., when the upper portion commenced to crush. The centering was removed about three weeks after the concrete was deposited in place.

"MORNING POST" BUILDING.

The view below of the "Morning Post" building in course of erection at the corner of Aldwych and the Strand was taken on Friday last, November 30th. The steelwork is now practically all erected, and the Columbian reinforced concrete floors constructed, while the granite facing has now reached the fourth-floor level. This is the largest and finest example of granite work in London. The granite is particularly light in colour, and it has quite as good an appearance as Portland stone, while possessing much superior weathering qualities: the cost is about the same as for Portland stone, and any mouldings can be worked; indeed it is remarkable to see the vigorous decorative carving that has been done in the material on this building. The granite comes from Norway, and has been supplied by Messrs. A. and F. Manuelle, who also were responsible for the remarkably striking granite work at the Ritz Hotel.

A new building in Grosvenor Road, Pimlico, for the Associated Portland Cement Manufacturers, Ltd., has just been completed. The building was designed by Mr. H. O. Cresswell on the Hennebique system of ferro-concrete, and constructed by Messrs. Holloway Brothers, of Belvedere Road, S.E. Last Thursday a successful test was carried out on a floor, the clear span of the main supporting beam being 16ft. The maximum deflection with a load of 6cwts. per sq. foot was $\frac{1}{2121}$ of the span, or about $\frac{2}{7}$ of the proportion of $\frac{1}{600}$ specified by the architect.



THE "MORNING POST" BUILDING, ALDWYCH, LONDON: PRESENT CONDITION OF WORK. MEWES AND DAVIS, ARCHITECTS.

THE WALDORF HOTEL.

In the "Concrete and Steel Supplement" to our issue for November 7th we published views of the Waldorf Hotel in course of construction. This building is making rapid progress, and we shall publish further views of the steelwork in our next supplement. The total amount of the steelwork being put in the building is about 1,400 tons. The view below shows the construction of a typical floor. This is being executed in reinforced concrete, the form of reinforcement being indented bars of high elastic limit, supplied by the Patent Indented Steel Bar Co., Ltd. Our view shows the manner in which centering is supported from timber joists spanning between the girders, thus obviating the usual props from the floor below, which so interfere with and hamper building operations. The view shows the rods placed in position, each rod being bent at one end into the form of a hook so as to hold on the top flange of the joist, while the other end is left overlapping the next joist so as to reinforce the top of the concrete floor at the point of contraflexure. The rods of each floor slab alternate, so that a hooked end is followed by a long overlapping end. The hooked ends are the only parts which require to be bent hot. The cranking of the rods is done when placing them into position by just stamping them down. The workman is shown ramming the concrete. There is an elaborate plant for crushing and mixing the concrete, which we shall deal with more particularly at a later date. The subcontractors for the concrete work are Messrs. Watson Brothers, of Glasgow; they are represented by Mr. Boyd Wilson, who has been connected with fireproof-floor construction for a great many years, and whose name may be familiar to some of our readers in connection with the report of the big fire at Dundee, published in our issue for August 29th, in which we referred (with illustrations) to two floors at Watson's bond which resisted the fire, it being mentioned that these floors were designed by Mr. Wilson.

THE LITERATURE OF REINFORCED CONCRETE.

The published information on reinforced-concrete work has already reached such large proportions that it is impossible for us to devote space to a full record of its extent: so rapidly is it growing, indeed, that much difficulty is experienced in keeping cognisant of it all, quite apart from digesting it. The student and those practically engaged in reinforced-concrete work should at least know, however, the general bearings of the field, and be familiar with the chief sources of information. We propose, therefore, to give in this article a general survey of the field.

The earliest writings upon the use of iron for the reinforcement of concrete are doubtless the specifications of the early patentees, for particulars of which we refer the reader to our issue for June 20th last. These, however, can hardly be included among the literature of the subject.

So far as we are aware, the first real contribution was the book issued for private circulation in 1877 by Thaddeus Hyatt, an American inventor. This described numerous tests on beams and materials carried out for the author by Mr. David Kirkcaldy, and a fire test conducted by the author. The book also gives a method of calculation for beams, and is altogether a remarkable essay. Its importance was never appreciated by the contemporary public, and it practically had no effect upon the development of reinforced concrete.

The succeeding years were without material addition to the theory of the subject, which was dealt with in the most haphazard and unenlightened way by means of catalogues of the few firms engaged in the construction of fire-resisting floors with concrete strengthened by steel.

In 1887 M. Bordenave brought out his system of reinforcing pipes and sewers.

In 1888 M. Edmond Coignet, knowing the use his father, M. François Coignet, had made of iron rods to strengthen concrete, placed before the Société des Ingénieurs Civils of France his ideas as to the disposition of metal to resist tension and concrete to resist compression.

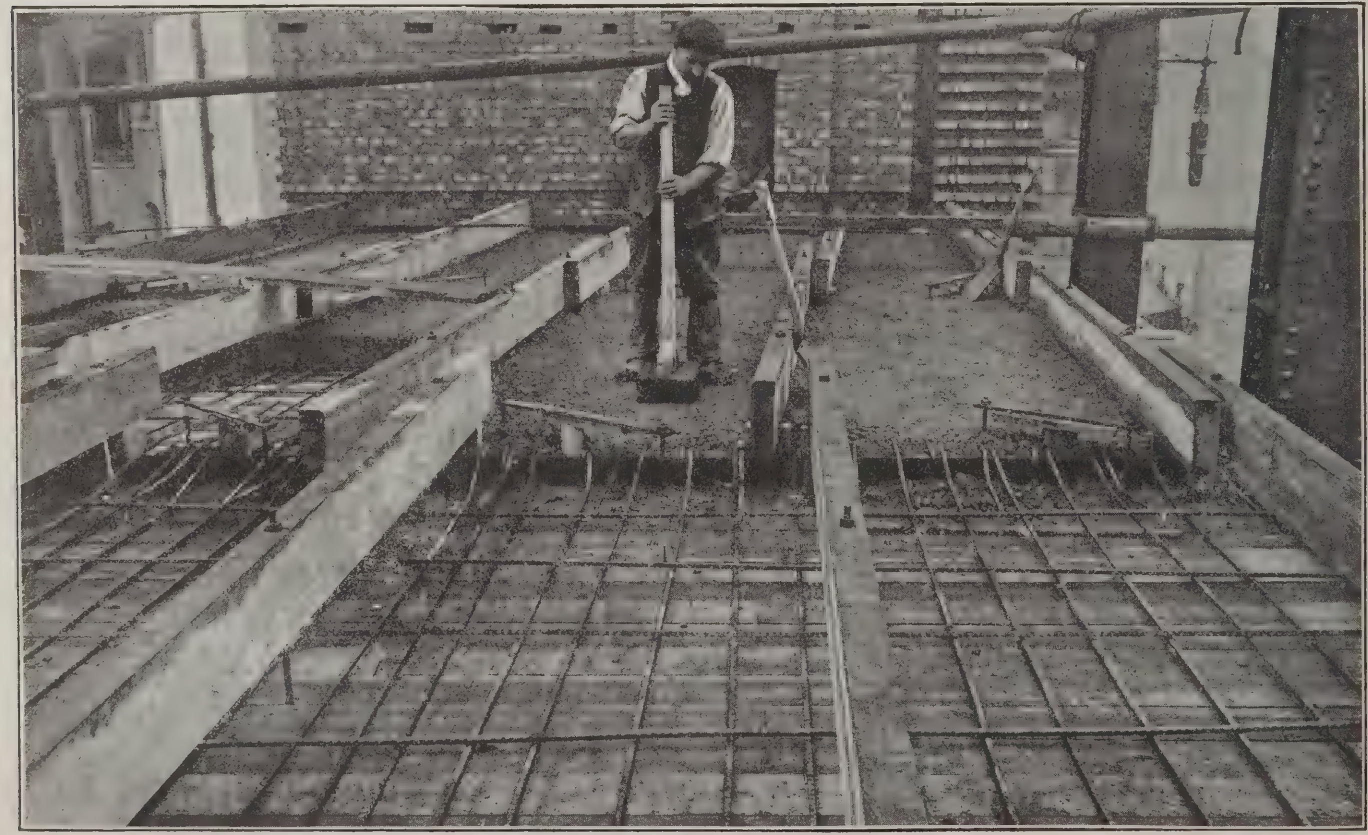
In 1889 M. Cottancin introduced his system, and M. Hennebique his in 1892.

The attention of engineers thus became attracted to the subject. M. Edmond Coignet and M. N. de Tedesco were the first to deduce rational methods of calculation for a combination of concrete and metal, and their paper, entitled "Du calcul des ouvrages en ciment avec ossature métallique," read before the Société des Ingénieurs Civils, and published in the Society's Bulletin for March, 1894, was the starting point of modern theory. This was the second real contribution to the subject.

Several engineers in the French government department of Ponts et Chausées, such as MM. Léon Stellat, L. Lefort, J. Resal and Harel de la Noë, investigated and discussed the matter in papers before societies between 1897 and 1899.

The first published contribution of M. Considère, Inspector-général des Ponts et Chaussées, giving the results of his careful laboratory experiments, which have done so much to establish theory, is to be found in the Comptes Rendus for September 18th, 1899.

Prof. J. Melan wrote on computations for concrete-iron construction in the "Oesterreichische Monatsschrift für den



REINFORCED CONCRETE FLOORS AT THE WALDORF HOTEL.

Oeffentlichen Baudienst," for December, 1896. Prof. J. B. Johnson contributed to the American "Engineering News" for October, 1897, an article on the calculation of the ultimate strength of concrete-steel beams. These two papers seem to be the start of a series of interesting contributions to theory in Austria and the United States respectively.

In 1896 Messrs. Fowler and Baker had tested a number of concrete slabs reinforced with expanded metal for the Expanded Metal Co., and further slabs were tested in 1899 by a sub-committee appointed by the Northern Architectural Association, the Newcastle, Gateshead and Tyne District Master-Builders' Association, and the Council of the Building Trades' Exchange. These tests were reported in our issues for December 6th and 20th, 1899.

In 1900 Mr. Philip Hobbs read a paper before the Northern Architectural Association, and on September 7th of the same year Mr. Arthur T. Walmisley, M.I.C.E., read a paper before the British Association, both of which papers dealt with the calculations for reinforced concrete. The latter referred to the experiments at Newcastle. A paper by Mr. James Bruce, discussing these same tests theoretically, and referring to reinforced concrete and a large warehouse then in course of erection on the Hennebique system in Newcastle, was read before the Northern Architectural Association on January 15th, 1902, and published in our issue for January 29th, 1902.

Early in the same year we published an illustrated article on "Armoured Concrete" by Mr. Andrew Johnston, M.I.C.E., M.I.M.E., in our annual publication "Specification," which dealt with the theory and practice of the subject.

Smaller contributions, such as articles, papers read, and reports on tests now become too numerous to detail. A good bibliography may be found in Taylor and Thompson's "Concrete, Plain and Reinforced."

In 1892 M. Paul Christophe, Ingénieur des Ponts et Chausées to the Belgian Government, published his admirable book "Béton Armé et ses Applications," and MM. C. Berger and V. Guillerme also published their "La Construction en Ciment Armé" in the same year. Mr. Charles F. Marsh was indebted to these two works, but chiefly to the former, for most of the material forming his book (the best and standard work in English), entitled "Reinforced Concrete," which was published in 1904 by Messrs. Archibald Constable & Co., Ltd. A revised and rewritten edition will be published in a week or two. M. Christophe's book also formed the basis of the first book on the subject (so far as we know) published in England, namely "Notes on Steel Concrete Construction," by Major J. Winn, R.E., published in 1903 by Messrs. W. & J. Mackay & Co., Ltd., at Chatham—an excellent little treatise.

In 1903 the results of M. Considère's investigations were collected from the reports and papers in French and translated into English by Leon S. Moisseiff, and published by Messrs. The McGraw Publishing Co., of New York, entitled "Experimental Researches on Reinforced Concrete." This book forms a valuable contribution.

If we continue for the moment to disregard foreign contributions and confine ourselves to English books, we must not ignore the contributions of specialist firms. In 1902 Mr. L. G. Mouchel, the agent for the Hennebique system in England, issued a large and important catalogue explanatory of this system and illustrating many executed works. This was reviewed at

In 1904 Mr. L. J. Mensch, representative

In 1892 Mr. L. J. Mensch, representative for the same system in Chicago, brought out his book called "Reinforced Concrete Construction," which was published by Mr. William Seafert, of Chicago. This also contains a good deal of useful information.

Contributions to both the theory and practice of the subject have appeared in successive editions of the catalogues of the Expanded Metal Co. in England and America, and other specialists in the latter country, such as Ransome, Thatcher, Kahn (of the Trussed Concrete Steel Co.) and Johnson (of the Expanded Metal and Corrugated Bar Co.).

The next general treatise to appear was "Reinforced Concrete Construction," by A. W. Buel and C. S. Hill, first issued in New York in 1904 and published in England by Messrs. Archibald Constable & Co., Ltd. This book is especially valuable for its digest of recent American contributions to theory and practice, especially as regards the latter, illustrations being given of about 200 reinforced concrete structures, with notes on their practical construction. The treatment of the theory and calculation of structures does not seem to us very enlightening, but to the practitioner it will be invaluable.

Prof. Wm. Cain's "Theory of Concrete Steel Arches and Vaulted Structures," published in New York in 1902, is a book for the specialist.

Mr. W. Noble Twelvetree's small book "Concrete Steel," published by Whitaker & Co. in 1905, was a fair summary of the fundamental principles of the subject, but the author's treatment was insufficient, even at that time, for much of the most recent information seemed to have been ignored by him.

Reinforced concrete is also dealt with at length in two excellent American treatises on the subject of concrete in general—namely, "A Treatise on Concrete Plain and Reinforced," by Frederick W. Taylor and Sanford E. Thompson, and "Cement and Concrete," by L. C. Sabin, published in 1904. The former book, by Messrs. Taylor and Thompson, is fairly thorough in its treatment of reinforced concrete, and as regards the general subject of concrete, contains an enormous amount of information that makes it invaluable; all students should possess the book, which is published by Messrs. John Wiley & Sons, of New York, and by Messrs. Chapman & Hall, Ltd., of London.

The most recent book also hails from America. This is "A Handbook on Reinforced Concrete," by F. D. Warren, published by Messrs. D. Van Nostrand Co., of New York, and Messrs. Crosby, Lockwood & Son, of London. It treats the subject in a very different way to other books. The first part of the book gives a general survey of the practical aspect of the subject; the second part records a series of tests carried out at the Massachusetts Institute of Technology, from which the author deduces constants and coefficients, which he adopts for preparing a series of tables given in Part III. from which he hopes the designer may obtain all necessary information to meet common cases in practice. The fourth part deals with the design of trussed roofs from a practical standpoint. We are not struck with the utility of the author's method, and as we disagree with some of his assumptions we cannot recommend the book to elementary students. It is, in our opinion, much better to refrain from endeavouring to standardise design yet, and better to give the various methods and data, so as to let the individual know where he stands. The book undoubtedly contains much valuable matter, but it should be in the hands of the experienced.

We may here step aside from our immediate subject to refer to two books that treat of subjects more or less allied. Concrete blocks are used very largely for building in the United States and are coming into use in England. The first book we have seen dealing with this important subject is "Concrete-Block Manufacture," by Harmon Howard Rice, a most instructive and excellently written work. It was published a few months ago by Messrs. John Wiley & Sons, of New York, and Messrs. Chapman & Hall, Ltd., of London, price 8s. 6d. nett.

Ordinary steelwork in modern buildings is so closely connected with reinforced concrete that the student and specialist require to make a study of it. There are many theoretical books on the subject, but scarcely any on the practical aspect, which is so important. Last year an excellent book, entitled "Constructional Steelwork," by A. W. Farnsworth, A.M.I.M.E., was published by Messrs. Charles Griffin & Co., Ltd., of London. This discusses in a most interesting manner the relation of theory to practice, the governing factor of economy, the duty of the designer, how drawings should be prepared, how to inspect and estimate for steelwork and practical shopwork.

Apart from books, a mass of information is available in periodicals, chief of which may be mentioned the "Engineering News" and the "Engineering Record," both United States weeklies. "Cement" and "Concrete" are also published in America.

On the Continent other important periodicals are "Beton und Eisen," "Zement und Beton," "Le Ciment," "Il Cemento," "Deutsche Bauzeitung," "Schweizerische Bauzeitung," and "Le Genie Civil."

As regards recent foreign books, we only find it necessary to add two to the list. In 1904 was published "Résistance des Matériaux appliquée au Béton et au Ciment Armé," written by M. N. de Tedesco, referred to above as responsible, with M. Coignet, for the first paper on rational calculations for reinforced concrete and M. A. Maurel, also another early investigator. The authors have had much experience in design and practical construction, and the book is of foremost importance as a contribution to theory. It critically reviews resarches and experiences, and puts forth much original matter.

The other work is of the nature of a "pocket-book," with a few pages of a diary in front for use as a desk companion. It is called "Beton-Kalender, 1906, taschenbuch für den Beton und Eisenbeton bau sowie verwaudte Fächer" and has been compiled by the staff of "Beton und Eisen." It contains a great amount of most valuable information as regards both theory and practice, with many illustrations. It is published by Messrs. Wilhelm Ernst & Sohn, of Berlin, at the remarkably low price of 3 marks (3s.).

NEW STREET STATION ROOF.

The collapse of a portion of the roof of Charing Cross Station, about a year ago, caused questions to be raised respecting the security of the roof over the original portion of New Street Station, Birmingham. During the present year a complete overhauling has been in progress. The roof is practically 53 years old. With a length of 1,080ft. it has a single girder span of 212ft., at a height of 75ft. from the rails. It was for a long time the largest single-span roof in the world. The girder consists of an elliptical double T of wrought-iron, which gives the roof its outline. Beneath this is a thick tie rod, also arched, and connected with the upper portion by twelve upright trusses of lattice work, the intervals between each upright being crossed by tension straps.

The examination which has recently been carried out shows that the roof has worn remarkably well, and is still perfectly secure. A good deal, however, has been learned during the last half-century, and, in order to provide an ample margin of security, as well as to add to the ultimate life of the roof, it has been deemed desirable to incur an expenditure of several thousand pounds in its reinforcement. For some months work has been going on in connection with the reconstruction of the wind screen at the south end of the station. This somewhat difficult undertaking is well advanced. To counteract any tendency to spreading in connection with the roof girders a supplementary tie bar is being applied to each, or a double strap of steel extending from foot to foot of the girder at a distance of about five feet below the original tie-bar, and braced up into a slightly arched form by rods depending from the main arch upon each side of the upright trusses.

The use of pneumatic tools enables this work to be done with a celerity which would not have been possible a few years ago. Up above an opening of the roof near the supporting columns in the private road of the station there has been constructed a platform upon which is placed the engine working the compression apparatus, and elastic tubes are carried along the scaffolding to the spot at which the riveting of the lengths of steel is carried on. Two of the reinforced girders are now fully exposed to view opposite to the Queen's Hotel portion of the station. It is seen that the effect will be to make the roof work look a little more complicated and a little lower than at present, but the operation of and the reason for the device is obvious. The work will take about six months to complete.

REINFORCED CONCRETE SYSTEMS.

VIII.—Broad-Flange Beams.

The ordinary fire-resisting floors constructed with small joists with narrow flanges between girders formed of larger joists of the ordinary standard section constitute a time-honoured method of construction. Recently, however, with the placing of broad flange beams upon the market as an ordinary commodity, a change has come o'er the scene, and we realise that the old construction can be improved in a good many radical ways without altering its entire principle.

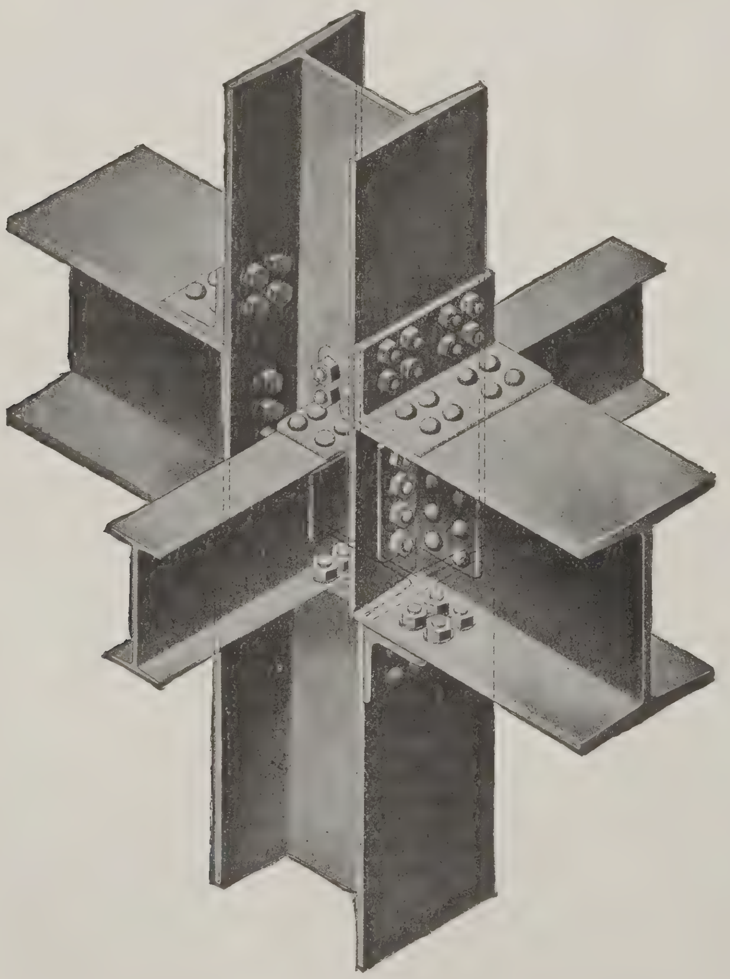


FIG. 7.—TYPICAL CONNECTIONS WITH BROAD FLANGE BEAMS

The standard section came into being for no theoretical reason: its narrow flanges were derived from considerations of practical necessity. The old-fashioned rolling-mill rolls sections of more than ordinary flange width with difficulty, because, as is evident, the deepest parts of the rolls which form the web have a much greater periphery than the periphery of the deepest part of the cut for the flanges.

The rolling mill

consists, as doubtless many readers are aware, of an upper and lower set of rolls, placed with their axes horizontal. The ingots are converted into blooms by first rolling them in what is known as a "blooming" or "cogging" mill. The flanges are formed by squeezing the metal into grooves in the rolls. The blooms are gradually reduced by being passed backwards and forwards through the rolls, until eventually they go through the "finishing pass" in the rolls and the joist is produced. Obviously if the flanges go too deep into the rolls they will travel at much slower speed on the smaller periphery than the web does on the larger periphery, and they will be torn, or the metal will become unsound.

Mr. Henry Grey, an Englishman who emigrated to the United States and eventually became manager of the Homestead Works of the well-known Carnegie Steel Co., invented a new form of mill known as the Grey Mill, which overcomes the difficulty of producing sections with deep flanges. In the Grey mill the bloom is first passed between an upper and lower roll of small size, whose sides are chamfered off. These rolls squeeze the material out at the sides to the approximate size of joist, and the "finishing pass" only rolls the flanges, which are truly squared. The rough section is then passed between another "stand" of rolls consisting of two horizontal chamfered rolls and two other rolls placed with their axes vertical. The horizontal rolls work upon the web, while the vertical ones roll the flanges. These latter take their motion from the material passing between and travel at a different rate to the main rolls. Consequently the flanges are rolled equally with the web, and the metal in very wide flanges is equally sound.

The Grey mill has enabled sections of rolled steel joists to be designed with more regard to theoretical economy. The broad flange beams have only 9 per cent. taper on the flanges as compared with the 14 per cent. taper on ordinary joists. The edges of the flanges are rolled square instead of being rounded off. Indeed, by suitable modifications of the mill, rolled steel joists can be produced without any taper on the flanges, with practically square corners throughout, and with thinner webs than it is possible to produce in the ordinary mill. Perhaps most important of all, the Grey mill rolls the section all over; pressure is exerted on both sides of the flanges and also upon their edges, so that the metal is thoroughly sound in every part of the section.

Broad Flanges Economical.

Broad flange beams, compared with the ordinary joists, show considerable economy in many ways. Take the case of two beams of approximately equal size and of equal carrying capacity, one with broad and the other with narrow flanges; if the section modulus is divided by the weight per foot it will be found that the

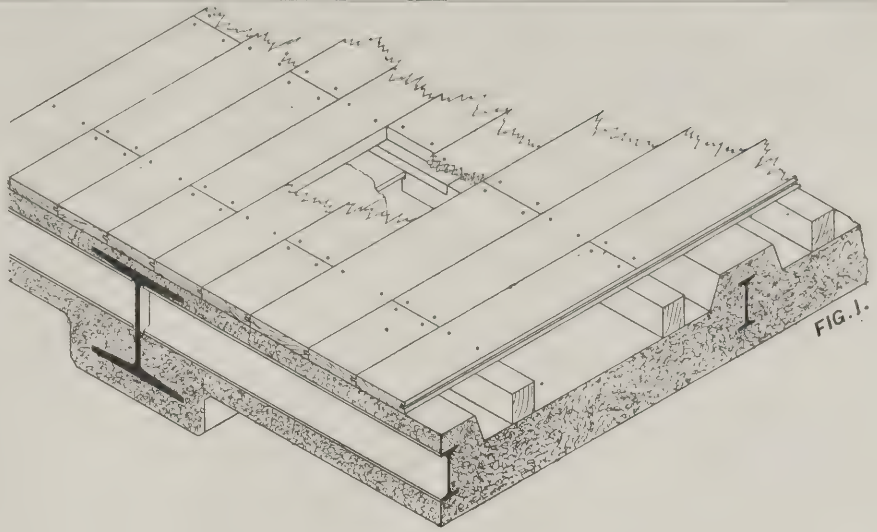

FIG. 1.

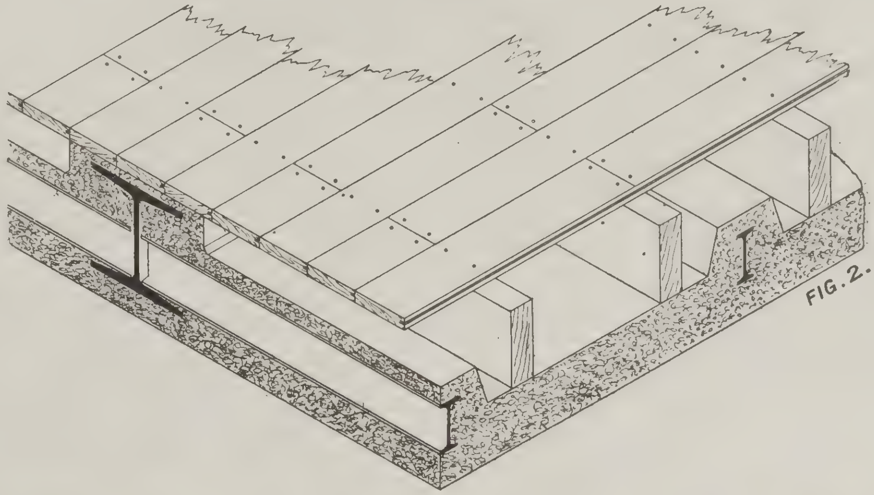

FIG. 2.

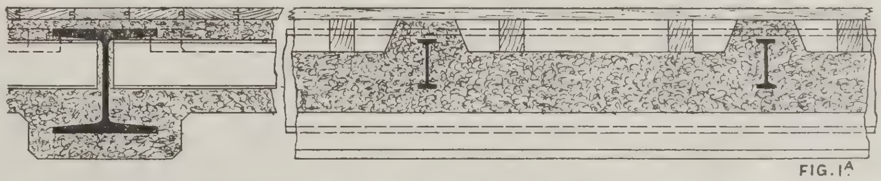

FIG. 1A

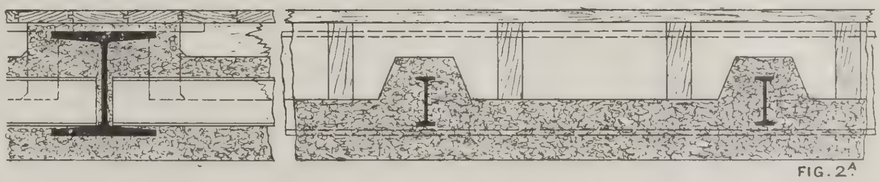

FIG. 2A

broad flange shows a bigger ratio of carrying power to weight than the narrow flanged beam. The economic value thus obtained shows that the broad flange beams on an average are estimated to show a saving in weight of 15½ per cent. and an average gain of nearly 5 per cent. over narrow-flanged sections. When we compare the larger sections of broad flange beams with ordinary compound or riveted girders, the saving is still greater for it is obvious that the cost of producing riveted girders is necessarily much greater than that of rolled steel beams, because the amount of workmanship required is so much more. And the above estimate does not take account of the considerable saving effected in the practical advantages which the broad flange beam offers in the way of economising workmanship in connections. The narrow flange beam permits of practically only one rivet hole in the width of the flange at the side of the web, and this, too, of small diameter. Usually ¾-in. rivets are adopted; with the broad flange beams ⅞-in. rivets can be used; thus, three rivets in the case of broad flange beams will do the work of four rivets in the case of narrow flange beams. Two rows can be put side by side in the flanges of large sections of broad flange beams. When the broad flanged sections are used for both beams and stanchions the possibility of using double rows of rivets allows the connections to be much simplified, as shown, for instance, in Fig. 7. If this illustration is compared with a connection between ordinary beams and stanchions doing equal work this simplicity will be very evident. Where the loads with ordinary sections require a compound girder, the simplicity of the connections with the broad-flange beams becomes more striking. The interior flanges of compound double web girders are practically inaccessible, and, consequently, it is customary to secure the upper flanges by a couple of bolts only. Thus there is no adequate provision for lateral stability with such compound girders. Fig. 7 shows how, in the case of broad flange beams, lateral stability is adequately secured. It will be seen from this view that the web cleats are riveted to the web by a double row of rivets in order to obtain a good hold on the web.

Used for Stanchions.

As regards the use of broad-flange beams for stanchions, these possess advantages over the ordinary built up stanchions composed of plates, joists, channels, and Z bars, firstly, in reducing labour in construction, erection and design; secondly, in being easily accessible for painting and less liable to rust than built sections; and, thirdly, in giving greater stability owing to the greater strength of the connections when broad-flange girders are employed in conjunction. The superiority of the square-shaped broad-flange section over the narrow-flanged joists for use as a stanchion is obvious. Weight for weight, the carrying-power of broad-flange beams used as stanchions is stated to be usually about twice as great as that of ordinary joists of the same depth.

We see, thus, that broad-flange beams offer many advantages in steel frame construction, and, consequently, they will no doubt come into much greater use in modern buildings in the next few years. We may, therefore, profitably consider the relation they bear to the problems of fire-resisting floor construction in reinforced concrete. Figs. 1, 2, 3, 4, 5 and 6 show various methods of constructing concrete floors reinforced with ordinary small rolled steel joists. The wide flanges of the broad-flange beams provide ample accommodation for the housing of steel joists, while the lateral resistance of wide-flanged sections makes them particularly suitable for arched concrete floors, the inside width of the flanges also providing an excellent abutment for the arches.

For flat concrete floors, broad-flange beams offer a much larger surface for the adhesion of the concrete than narrow-flange beams; indeed, quite 25 per cent. Consequently, the steel joists do not cut up the concrete and destroy the continuity of the construction as they ordinarily do. The chief advantages, however, which the broad-flange beams offer are, reduction in depth of the main beams, and the end-fixing of the block of concrete between the flanges. As regards this latter point, it is evident that the wide and shallow block of concrete confined between the broad flanges is of great value as regards the end-fixing of the slab. When the ends of light joists reinforcement to the slab are embedded in concrete it is estimated that they have a carrying-power approaching that of fixed ends, which increases their normal carrying-power by 50 per cent. Consequently, the amount of metal required in a floor is very greatly reduced as regards the subsidiary joists, apart from the main beams.

Forms of Concrete Flooring.

It will be seen from Figs. 1, 1a, 2, 2a, 3 and 3a that the forms of flooring suggested by Messrs. H. J. Skelton & Co., who are the pioneers in regard to the use of broad-flange beams in this country, show a great saving in material and labour. The subsidiary joists need no connection to the main beams by riveted cleats, because the block of concrete confined between the wide flanges of the main beams securely holds them in position. In each case the thickness of the concrete under the steel joists, as shown, is 2in., in accordance with the generally accepted custom, and the concrete floor, as shown, is 5in., as required by some building regulations.

In Figs. 1 and 1a the main beams project below the ceiling. This is avoided in Figs. 2, 2a, 3 and 3a, the difference between the last two types of floor being that the wooden joists supporting the floor boards run in opposite directions. Fig. 2 has the advantage of reducing the depth of these wooden joists required in Fig. 3.

In Fig. 4 broad-flange beams of shallow depth are shown spaced closely so as to avoid the use of reinforcing metal. In the example illustrated, the beams are of 7-in. by 7-in. and 16-ft. span, the beams being spaced 3ft. 9in. centres. The floor is designed to carry a load of 2½cwts. Fig. 5 is a modification of Fig. 4, with the difference that the wooden joists bridge from beam to beam and relieve the concrete ceiling of any load except its own weight, so that it may be made thinner and regarded only as a fire-resisting screen.

Fire Resistance.

Fig. 6 is a detail taken from an actual floor of the type illustrated in Fig. 1. It will be observed that the ends of the joists are supported on ordinary bricks for convenience of erection. The bricks are plumbed level by means of wedges made of pieces of slate, &c. This view also shows the manner in which the bottom flanges should be protected by a sheet of expanded metal in order to prevent any concrete flaking off in a fire, which it is liable to do by reason of the slight deflection that takes place at high temperatures. If the bottom flange of an ordinary joist becomes bared in this way, the floor is almost certain to be entirely destroyed; but it is a remarkable fact that the first fire test on a floor constructed with broad-flanged beams carried out by the British Fire-prevention Committee showed that the broad-flange beams, although greatly deflected, still remained in position, due, no doubt, to the concrete held between the wide flanges.

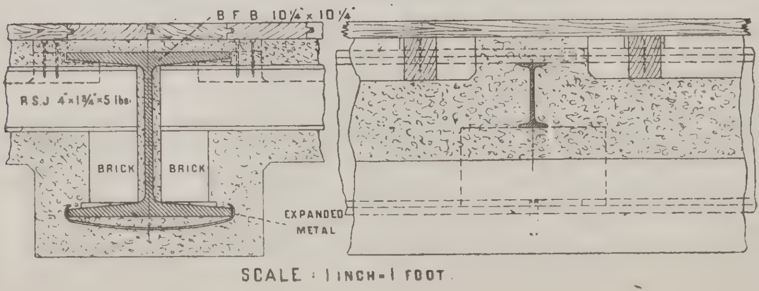
FIG. 6



SCALE : 1 INCH = 1 FOOT.

Briefly, the principal advantages of such a type of floor are simplicity and cheapness, the economy consisting in the saving of about 10 per cent. in the weight of main girders and of about 30 per cent. in the weight of intermediate joists, owing to the end-fixing above referred to, and finally by the saving of labour in the riveting of angles to the webs of the main beams. In addition there are the advantages of no skilled labour being required in erection, no time being lost in fitting and building up, and considerable head-room being saved.

Practical Advantages.

Although concrete floors reinforced with small joists, looked at from the point of view of modern reinforced concrete theory, shows a waste of metal, this is counteracted by the fact that the metal sections of which they are built are of the commonest description and that floors can be easily calculated. The heavy expenses incurred by the proprietors of patented systems are thus claimed to be avoided, while the cost of centering (such a large item in reinforced concrete work) is reduced by the builder being able to support the centering from the joists, and remove it speedily, thus facilitating building operations.

We referred above to a report upon two fire tests which were carried out by the British Fire Prevention Committee. The first floor was executed with Thames ballast concrete, which is notoriously inefficient from a fire-resisting point of view. Consequently, this fire test was a failure, although it sufficed to show the considerable resistance which the broad-flange beam has over the ordinary joist. The second test, however, in which clinker concrete was used and the soffit of the beams protected by a sheet of expanded metal arranged as shown in Fig. 6, was an absolute success, the maximum deflection being only .35in. after four hours (and this was not permanent, being entirely recovered when the floor had cooled). We refer our readers to our report on this test in our issue of May 9 for further details.

New Factors in Design.

Architects and designers of steelwork should study the broad-flange beam closely in connection with any work they have in hand, because, as we have endeavoured to convey above, it has changed the factors governing design. Logically used, the broad-flange beam undoubtedly offers very great advantages in many circumstances, and now that it has become an ordinary commodity and is likely to be still more largely manufactured in the near future, it will produce a radical change in steel-frame construction.

Messrs. H. J. Skelton & Co., of 71, Finsbury Pavement, London, E.C., the well-known steel merchants and manufacturers, are primarliy responsible for bringing the broad-flange beam prominently before the profession, and they publish some valuable information regarding these broad-flange beams which should be carefully kept for reference.

In specifying broad-flange beams care should be taken to state that they must be rolled by the Grey mill, the only type of mill which can efficiently produce them, because although others may have approximately the same section, the flanges cannot have the same strength or soundness of metal as the web when rolled by the ordinary mill.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL ENGINEER.

December 12, 1906. Volume 24, No. 618.

NOTICES.

Offices: 6, Great New Street, Fetter Lane, London, E.C.

Telegraphic Address: "Buildable, London."

Telephone Numbers: 2200 Holborn, 2201 Holborn, 2202 Holborn and 2203 Holborn.

Date of Publication: The Builder's Journal and Architectural Engineer is published every Wednesday, price 2d.

A Special Supplement is regularly presented free with the ordinary issue, three weeks out of every four. These three regular monthly supplements are entitled "Contractors' Supplement," "Concrete and Steel Supplement," and "Fire Supplement" respectively.

The "Contractors' Supplement" is presented with this issue.

The Subscription Rates per annum are as follows:—

At all newsagents' and bookstalls - - 8s. 8d.
By post in the United Kingdom - - 10s. 10d.
By post to all places abroad - - - - 17s. 4d.

The Government adopts Reinforced Concrete.

The fact deserves to be widely made known that the new General Post Office building to be erected on the site of Christ's Hospital, Newgate Street, is to be constructed of reinforced concrete. The magnitude of this building and the fact that it is a Government one, will bring the use of reinforced concrete into greater prominence than it has ever attained before in this country, while this action of the Office of Works sets an official seal upon the utility and reliability of this method of constructing buildings which must convince the authorities who have the regulation of building by-laws throughout the country, and who have so hampered the progress of reinforced concrete with their out-of-date by-laws. We hear that it is proposed to adopt reinforced concrete for the construction of other Post-office buildings, while the Admiralty has already employed it and has arranged for the erection of other structures. It certainly looks as though the various specialists in this form of construction were going to experience a great boom in the immediate future, more especially as the building trade is recovering from the depression of the last few years, and next year promises to see a great revival. We were foremost in realising the importance of paying special attention to reinforced concrete construction, adding a special monthly "Concrete and Steel Supplement" to our other features. Our enterprise, we are glad to know, has been widely appreciated by the architectural profession and building trades. The extension of the General Post Office will cover an area of nearly 2½ acres and provide accommodation to the extent of 11½ acres of floor surface. The building has been designed by Sir Henry Tanner, principal architect to H.M. Office of Works, on the Hennebique reinforced concrete system.

Restoration at Holyrood.

The late Lord Leven left a direction in his will for the restoration of the Chapel Royal at Holyrood, with the proviso that Lord Balcarres and Sir John Stirling-Maxwell should accept responsibility for carrying out the work. Professor W. R. Lethaby was instructed to make a very careful report, and as his report is not favourable to the proposal, it has been intimated to His Majesty's Office of Works and to Lord Leven's executors that the restoration cannot be proceeded with. The ruin, it may be mentioned, is the nave of the original church, most of the existing work being of a very beautful type of early thirteenth-century architecture: indeed, Professor Lethaby speaks of the west door as being "the noblest thirteenth-century doorway in Great Britain," after the splendid south doorway at Lincoln Cathedral. The walls and arches which remain are much decayed and disintegrated, capitals being shapeless masses and mouldings and details all perished. Professor Lethaby considers it would be impossible to restore the ruin for use as a modern chapel without the ancient architecture almost completely disappearing in the process, and he earnestly recommends that no scheme of rebuilding or addition should be entered upon. As Professor Lethaby says, the problem of making a modern building out of an ancient ruin is beset with difficulties which cannot satisfactorily be solved, because there is not sufficient evidence for restoring features which have been lost, and there is nothing interesting or commendable in conjectural restoration of such work. This must always be so: hence we think the best thing is not to attempt any such restorations. We know they were attempted in the last century, but it is earnestly to be hoped that there will not be any repetition of such unfortunate energy. What is wanted is to look after the old work before it has fallen into a complete state of ruin. The common policy, however, seems to be to let the stonework perish into formless masses, and then to start a full-blown scheme for clearing away the old work and putting up a modern copy, which is always hopeless.

The Filthy Condition of Waterloo Bridge.

In his presidential address to the Institute this year, Mr. Collcutt reiterated the suggestion for covered bridges across the Thames. The suggestion is an excellent one, we think, but we fear it is not likely to be carried out just yet. In the meantime, however, the London County Council might make an attempt to keep one of the most exposed of the Thames bridges—Waterloo Bridge—in something like a clean state. At this time of the year especially the matter calls for attention. The roadway gets into a disgraceful condition in wet weather, and the thousands of pedestrians who have to cross the bridge every day are plastered with filthy mud from the crowd of vehicles. Now and again there is a vision of a few boys with squeegees, but their efforts are very diminutive. And things are not much better when the weather gets fine again, for the refuse on the roadway now blows into one's face, and it is frankly ludicrous to see one man with one hand water-truck (that might very well have come out of a museum) covering the pavement with a series of trickles. The condition in which this bridge is kept is a disgrace to the County Council.

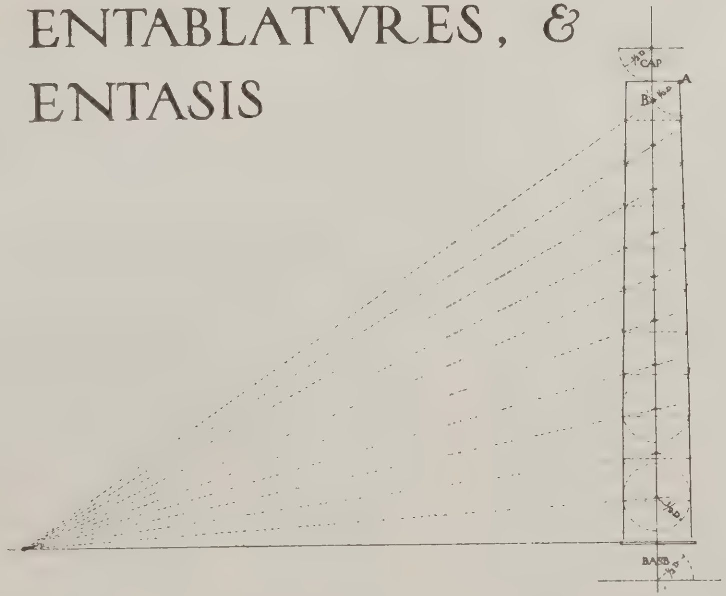
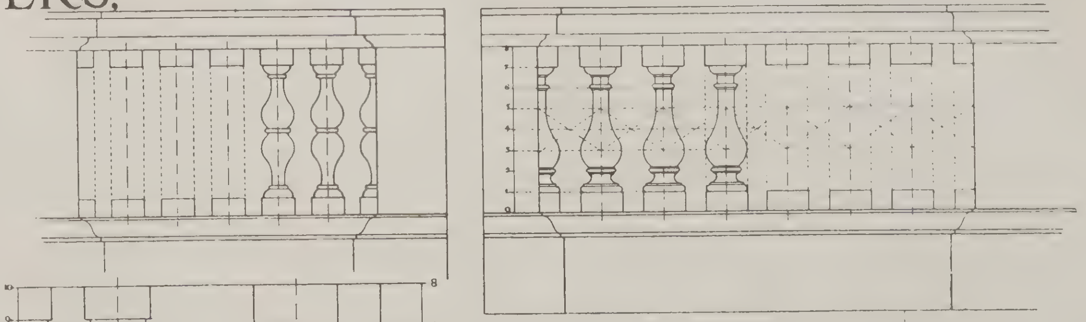
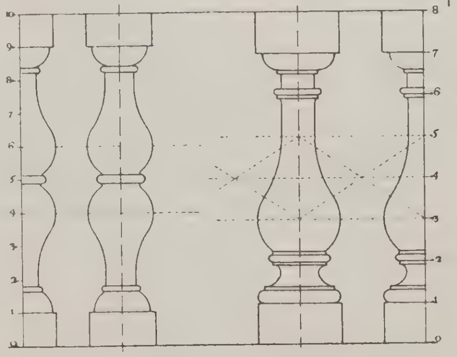
BLOCK CORNICES, BALUSTERS, ENTABLATURES, & ENTASIS

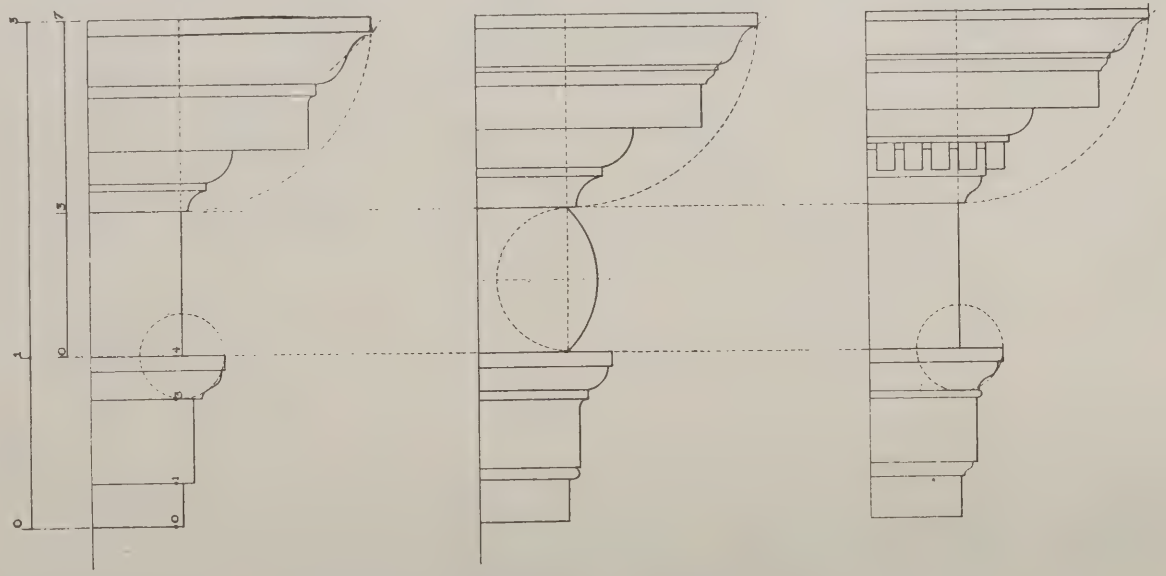


METHOD OF SETTING OUT ENTASIS

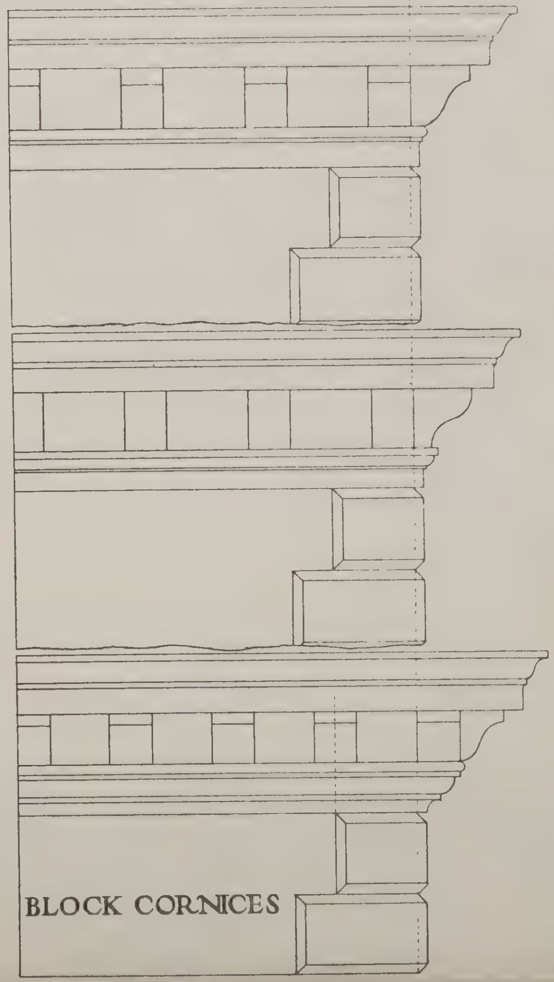




BALUSTERS.



DOOR & WINDOW CORNICES



BLOCK CORNICES

THE ORDERS AND THEIR APPLICATION. BY ALFRED W. S. CROSS, M.A., F.R.I.B.A., AND ALAN E. MUNBY, M.A.

PRACTICAL NOTES FOR ARCHITECTURAL DRAUGHTSMEN

By Alfred W. S. Cross, M.A., F.R.I.B.A., and Alan E. Munby, M.A.

THE ORDERS AND THEIR APPLICATION.

(Concluded from p. 244, No. 615.)

Plate XI.

Niches.

The general treatment of niches resembles so closely that of doors and windows that but few further remarks are requisite. The height of a niche opening should never exceed 2½ times its width, nor be less than twice its width, unless designed for a bust or ornament of similar form, when, if the ornament have no pedestal, it may be a little more than square. The opening is generally carried to the bottom of the surrounding treatment, though the examples, given by Gibbs, show an equal margin all round the aperture. Whether a margin be included at the base or not, it is always provided at the sides and head of the niche.

On plan niches are generally semi-circular, and the head, which may be plain or treated with a shell ornament, is therefore, quadrispherical. The depth of the niche must be sufficient to contain the whole of any statuary placed within it.

If impost mouldings mark the springing of the niche arch they should not be continued round the aperture internally if any use is to be made of it, as complete internal repose is essential for the background of any contained composition.

Plate XII.

Entablatures for Doors and Windows.

The three entablatures shown on this plate will be seen to conform, broadly speaking, with those previously given. The friezes, however, are somewhat narrower, and the architraves rather wider than those shown with the Orders. These examples are suitable for door and window dressings, more particularly for internal work. The architraves as shown are one-third the total height; of the remainder, three-sevenths are given to the frieze and four-sevenths to the cornice. The projection of the architrave is increased to one-quarter its height.

Pulvinated friezes may be effectively used with these entablatures. To set out the pulvination the frieze is bisected vertically on a line in the plane of the lowest face of the architrave. A semi-circle is drawn internally with this point as centre and half the width of the frieze as radius, and the point at which a horizontal line bisecting the frieze cuts this semi-circle is the centre from which the curve of the frieze is to be struck from its extremities on the vertical face line previously drawn.

The dimensions of the entablature may be taken from the rule previously given for the height of the architrave, which should not exceed one-sixth the width of the opening thus crowned.

Palladio makes his friezes equal in height to the architrave if flat, but only three-fourths of the height if pulvinated, while the cornice in either case is about five-fourths of the height of the architrave.

Block Cornices.

A building is often finished with a cornice when no Orders are used in its composition. Such cornices, known as block cornices, differ in some measure from those used with the Orders. The ordinary forms are usually adopted as far as the base of the corona, but the modillion blocks below are often equal in height to the whole of the members above, while the members terminating the cornice below partake more of the nature of an architrave than ordinary bed moulds. The height of the cornice is greater than its projection, a ratio of 3 to 2 for these dimensions forming a suitable proportion.

Quoin stones when used should be about half the height of the cornice, and their lengths may be alternately as 2 to 3, the shorter stones being somewhat longer than they are high. In all cases of quoins and rustic work questions of bonding will generally decide the exact height to be adopted.

The height of a block cornice should be proportional to the height of the building. An average of ten examples quoted by Gwilt gives this height as one-fifteenth the height of the building, but when subsidiary cornices are used between storeys this height may be reduced. In dealing with Plate VI. the rule given by Gibbs—namely, that the height of the cornice should be one-eighteenth of the height of the storey crowned—has already been cited.

Another modification of an entablature —in which the frieze is omitted—known as an architrave cornice, was often used by the old masters. This is generally to be found over arched work in which the height of a full entablature would have been excessive.

Balusters.

Of the many forms of balusters used in compositions two have been selected for illustration. There are but few forms which commend themselves when drawn to a large scale, but taken together in execution the effect is generally superior to that obtained on a drawing. Those with the single swelling are more suitable for heavy compositions, whilst the double-bellied example, which may be varied in detail, is well adapted for short lengths of lighter work. Chambers, from whose "Civil Architecture" many of the rules previously given have been culled, points out that the height of a balustrade for use should be between 3ft. and 3ft. 6ins., but so far as treatment is concerned the height should be between two-thirds and four-fifths of the height of the supporting entablature, this proportion including only as much of the balustrade as can be seen by the ordinary observer. In the case of single-bellied balusters he divides the whole height of the balustrade into 13 parts, giving 3 to the plinth and base, 8 to the balusters, and 2 to the rail. In the case of balustrades of a lighter character he divides the whole height into 9 parts, giving 3 to the base, 4 to the baluster, and 2 to the rail. The examples illustrated show the adoption by Gibbs of not greatly dissimilar proportions.

The space between the balusters is equal to half their width, and a half baluster is placed against pedestal breaks or other terminations. The number of balusters between breaks in a balustrade will often be fixed by the treatment below, but 8 or 9 whole balusters are said to produce the most effective result. The width of the pedestal die should equal the upper diameter of the column below, but where columns do not occur in the composition the die may be about square, and in long ranges the principal breaks may project and be flanked by half dies on either side, having, of course, similar cap and base treatments continued round them. The method of proportioning the baluter itself and its setting-out are fully indicated on the plate.

Balusters should not be used on pediments, but when on the rake of steps the base and rail follow the rake, while the balusters maintain their vertical treatment, producing wedge-shaped terminations against the base and rail.

If statues are placed on a crowning balustrade their height should not exceed one-quarter the height of the column and entablature below them, and vases should be about two-thirds this height.

Entasis.

Several methods for setting out the entasis of columns are given by different authorities. As previously stated, the entasis may start one-third up the column, below which height the column is a true cylinder. Since, however, it is difficult to work a column so that this starting point is not apparent, it is better when setting out the entasis to a large scale to start from the bottom of the shaft. In the method shown on the plate, the centre line of the column and its top and bottom diameter having been fixed, the length of half the lower diameter is drawn downwards from the face of the column at the top in such a direction as to touch the centre line. This line (A B in the figure) is continued downwards until it cuts a horizontal line drawn from the base of the shaft. Any number of rays from this point of intersection are then drawn to cut the centre line and the semi-diameter placed along such lines, with one end upon the centre line, will at its other end cut the surface of the column on the entasis curve. Hence a line drawn through the points so obtained will give the outline required. The entasis of the other side of the column is obviously obtained by drawing horizontal lines through the points previously obtained and marking off spaces equidistant thereto from the centre line.

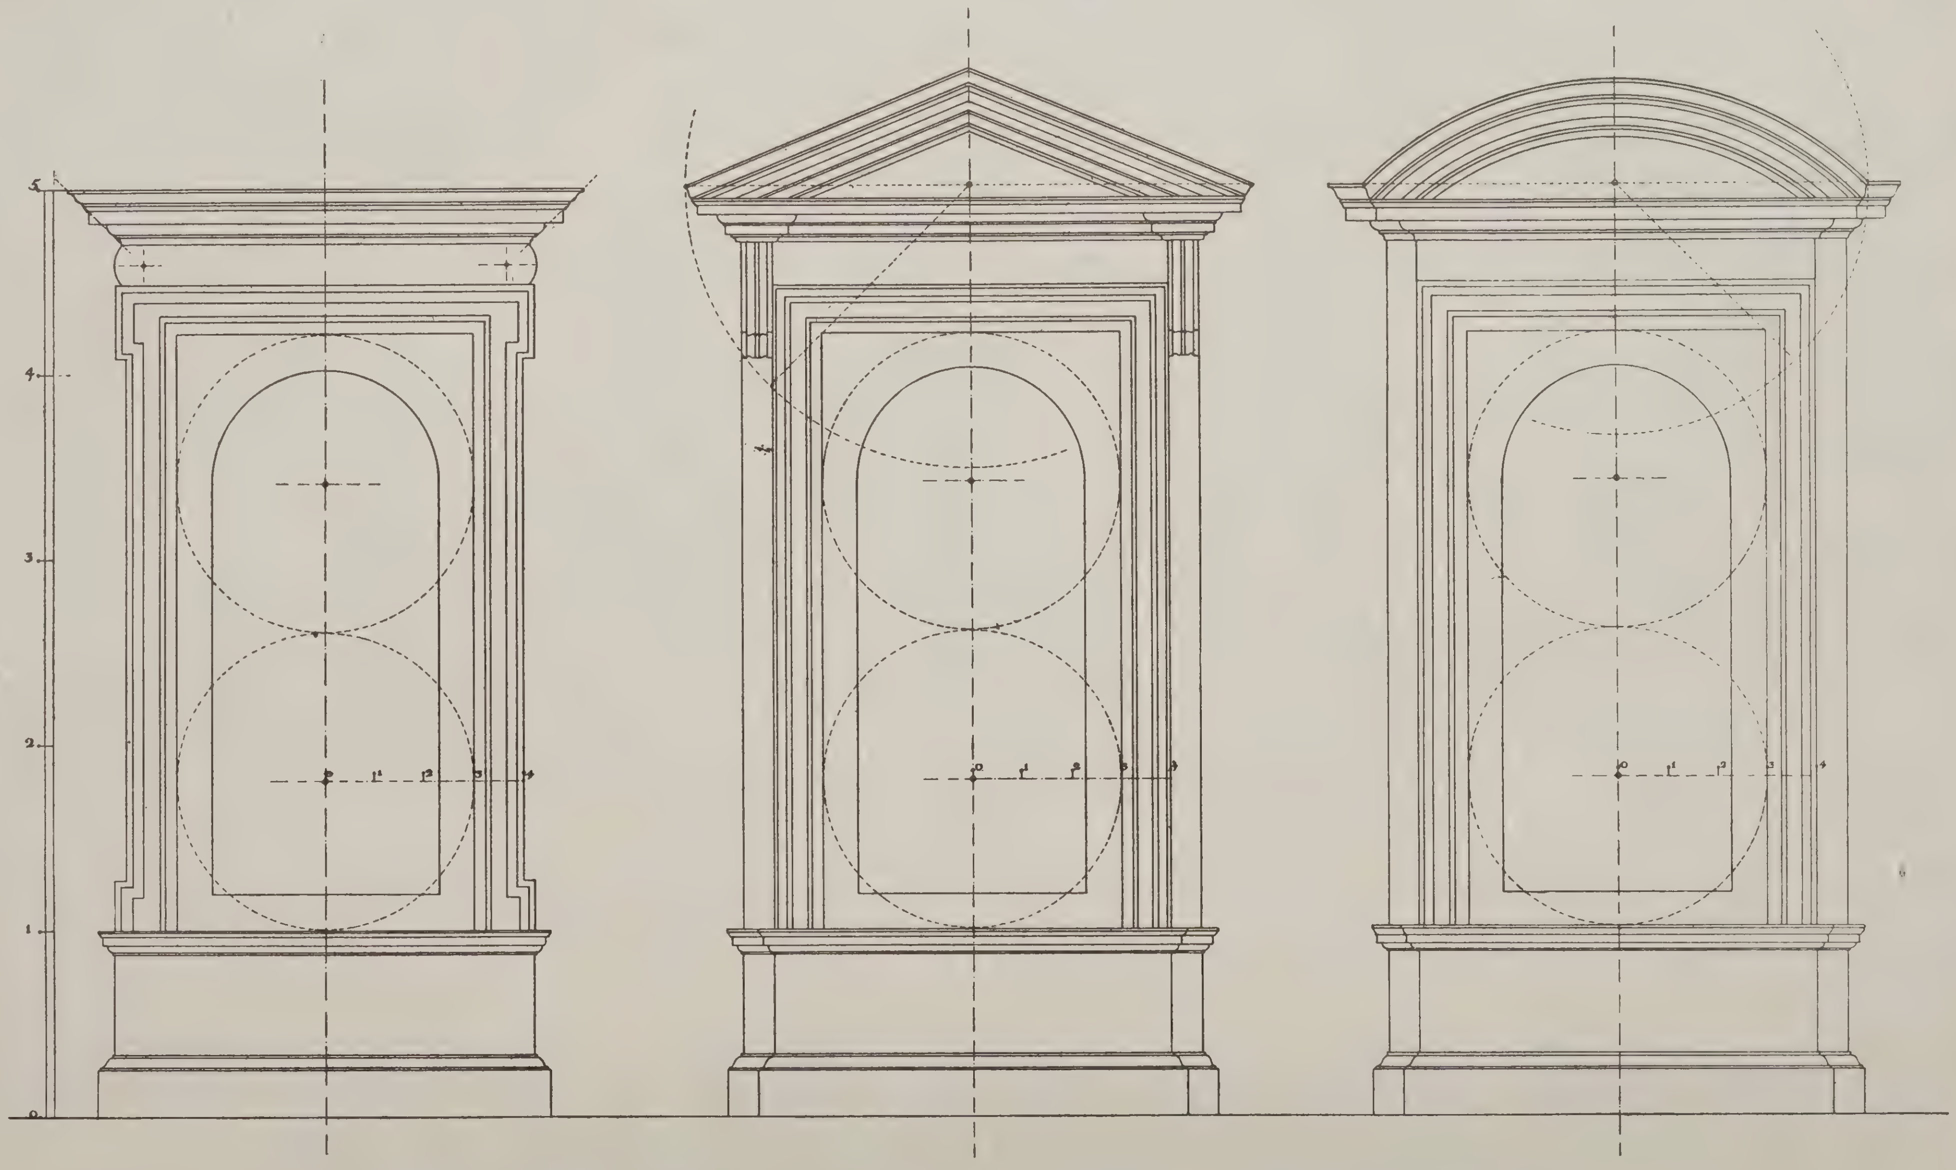
The publication of Plates XI. and XII. in this issue completes the first portion of this series, dealing with the Orders and their application. The following is a list of the subjects dealt with, with dates of the issues in which the matter and illustrations appeared :—

Plate I.—The four Orders. (*Sept. 19th.*)
,, II.—The Tuscan and Doric Orders in detail. (*October 3rd.*)
,, III.—The Ionic and Corinthian Orders in detail. (*October 3rd.*)
,, IV.—Examples of Arcading. (*October 24th.*)
,, V.—Details of Imposts and Arch Mouldings. (*October 24th.*)
,, VI.—Order upon Order, and Intercolumniation. (*November 7th.*)
,, VII.—Doorways and Pediments. (*November 21st.*)
,, VIII.—Windows with Entablatures. (*November 21st.*)
,, IX.—Windows, rusticated treatment. (*November 21st.*)
,, X.—Venetian and other Windows. (*November 21st.*)
,, XI.—Niches and their treatment. (*December 12th.*)
,, XII.—Block Cornices, Balusters, Entablatures and Entasis. (*December 12th.*)

The second portion of this interesting series will be commenced next month. Perspective, shadows, and various other matters will be dealt with.

NICHES & THEIR TREATMENT

PLATE JJ.



THE ORDERS AND THEIR APPLICATION. BY ALFRED W. S. CROSS, M.A., F.R.I.B.A., AND ALAN E. MUNBY, M.A.

Correspondence.

Bending Moments on Continuous Girder.

To the Editor of The Builders' Journal.

Sir,—Prof. Adams's reply on p. 228 of your issue for November 7th regarding the bending moments and reactions of a continuous girder gives only rough approximations, which, in some instances are seriously in error.

The table below gives the actual bending moments, calculated by the "theorem of three moments," and the reactions determined from the bending moments and the loading. Four cases are given—namely (1) all spans loaded; (2) outer spans only loaded; (3) centre span only loaded; and (4) centre span and one outer span loaded.

In each case the loading has been taken at 1 ton per lineal ft. The letters A, B, C, D represent the points of support proceeding from left to right.

	Supports.	A	B	C	D	Remarks,
I.	Bending Moments ...	Nil	32·87	32·87	Nil	All spans loaded.
	Reactions	5·95	20·05	20·05	5·95	
II.	Bending Moments ...	Nil	11·13	11·13	Nil	Outer spans loaded.
	Reactions	7·31	8·69	8·69	7·31	Centre span unloaded.
III.	Bending Moments ...	Nil	21·74	21·74	Nil	Outer spans unloaded.
	Reactions	— 1·36	11·36	11·36	— 1·36	Centre span loaded.
IV.	Bending Moments ...	Nil	17·46	37·15	Nil	Spans B., C. and C., D, loaded.
	Reactions	— 1·09	10·105	21·305	5·68	A., B. unloaded.

The bending moments are given in ft.-tons, and the reactions in tons. The weight of the girder has been neglected.

It will be observed that in case III. the outer reactions are negative. Consequently, in this case the outer spans will have no bending moment, unless they are held down; if they are not held down the centre span will have to be treated as a beam simply supported at its ends, and in these circumstances the bending moments at supports B and C vanish and the reactions at these supports become each 10 tons, instead of 11.36 tons.

Referring to case IV., it will be seen that the reaction of the outer support next the unloaded span is negative. For a similar reason to case III. there will be no bending moment in the unloaded span, unless the support with the negative reaction is held down; if this support be not held down, then the bending moment at support B vanishes and the spans BC and CD will have to be dealt with as continuous girders having two spans only.—Yours truly,

DE SILVA.

To the Editor of The Builders' Journal.

Sir,—The results given in the reply,[*] referred to above, were obtained from Humber's "Handy Book of Strains," which has been a standard work for the last forty years. They were only given as approximate, and "de Silva's" results may be more accurate, but it would have been interesting to see his graphic diagrams for the four cases with the requisite formulæ.—Yours truly,

HENRY ADAMS.

London.

"A Municipal College of Arts."

To the Editor of The Builders Journal.

Sir,—The statement in your issue for last week that Mr. MacGillivray, R.S.A., is the person responsible for the idea of forming a municipal college is entirely erroneous. The movement was initiated by Sir Rowand Anderson, when the School of Applied Art was founded about 15 years ago, for the teaching of architecture and the allied arts, and by bringing students of all the arts in contact with one another, a far greater insight and broader outlook would therefore follow. This school was modelled on the lines of the Ecole des Beaux Arts, Paris, the main idea being to break away from the South Kensington *régime.* It was carried on under the Board of Manufacturers for Scotland, and later received the patronage of the Edinburgh Town Council.

The idea to form one large municipal school of Fine and Decorative Arts is the outcome of a combined movement of many persons connected with art in Edinburgh. A committee was formed to bring the matter before the municipal authorities, who undertook to give effect to the desire. Mr. MacGillivray was suggested by one of the councillors as an artist who might be asked to give his opinion as to the most suitable plan to adopt and as to the method of working the school.

That Mr. MacGillivray should receive the entire credit is unfair to all the other persons who have been instrumental in bringing about this much-desired institution.—Yours truly,

J. Myrtle Smith.

[The statement referred to was based on particulars given in the Scottish Press, which we took to be correct.—*Ed.* B. J.]

Notes and News

The Bournemouth Undercliff Drive has been approved by the Board of Trade, and a tender for the work, amounting to nearly £17,000, has been provisionally accepted.

New Baths at Handsworth have been erected at the corner of Hinstock Road and Grove Lane at a cost of about £22,000 (inclusive of site).

Gloucestershire Architectural Association.—A general meeting of this Association (which was formed recently) was held two weeks ago at Gloucester, the chair being occupied by Mr. F. W. Waller. It was decided to forward a note of condolence to the relatives of the late Mr. H. A. Prothero. The minutes of the founders' meeting were then read and confirmed, and draft rules of the Association were considered, amended, and formally adopted by the Association. Officers for the ensuing year were then elected as follows:—President, Mr. F. W. Waller, F.R.I.B.A.; vice-presidents, Mr. M. H. Medland, F.R.I.B.A., and Mr. H. W. Chatters, F.R.I.B.A.; council, Mr. W. B. Wood, A.R.I.B.A., Mr. J. Villar, F.S.I., and Mr. H. A. Dancey, M.S.A.; hon. corresponding secretaries, Mr. F. Fletcher Trew, M.S.A., Gloucester, and Mr. G. P. Milnes, A.M.I.C.E., Stroud; general secretary, Mr. T. Overbury, M.S.A., Lloyd's Bank Chambers, Cheltenham.

The Betterment of Liverpool in respect of its streets and buildings is the aim of a society which has just been formed at the instigation of the Liverpool Architectural Society.

At St. Stephen's Vicarage, Southwark, a much-needed parsonage has been completed. Mr. John W. Rhodes, of Mitre Court Chambers, Temple, E.C., was the architect, and Messrs. Spiers & Son, of St. John's Wood, N.W., were the builders.

A New Church and Institute of the Missions to Seamen has been erected at Tilbury Docks, from designs by Messrs. James & Laycock, of 4, Bloomsbury Place, W.C. The contractors were Messrs. Patman & Fotheringham.

New Premises for Messrs. Novello & Co., the well-known firm of music publishers, have just been completed in Wardour Street from designs by Mr. F. L. Pearson, F.R.I.B.A. The building is in Renaissance style, carried out in red brick and stone, and includes a hall 44ft. by 36ft. by 24ft. high, which takes the place of the old shop. This hall is panelled out in oak, with carved embellishments.

St. Mark's Campanile.— In his report to the Syndic of Venice, Prof. Luxardo recommends that the new Campanile of St. Mark, as built, shall be cut down to the base of the foundations, and a fresh start made. This drastic course is urged as a result of a careful analysis of the materials used, it having been found that the bricks and cement are both very defective.

New Buildings in Glasgow. — The photograph of the entrance doorway to the Edinburgh Life Building, Glasgow, on page 253 of our issue for November 28th, should have been attributed to Messrs. T. and R. Annan & Sons, not to Messrs. Bedford Lemere & Co. The clerk of works for this building, and also for the other new buildings in Glasgow by Mr. John A. Campbell, was Mr. John Bowman.

ENGLISH AND FRENCH ARCHITECTURE.

Mr. W. H. Bidlake gave a lecture on this subject before the Birmingham Architectural Association on November 30th. He pointed out that Englishmen and Frenchmen had carried out their antagonism so far as to dispute each other's claim as to the origin of Gothic architecture; but in these days of the *entente cordiale* we were willing to make mutual concessions. While the French allowed that the high vaults like those of Durham and the English Decorated style were the precursor of the French Flamboyant, we, on our part, allowed the great French cathedrals to be the most perfect expression of Gothic art. Proceeding to make a comparison between the French and English cathedrals, Mr. Bidlake pointed out the much greater loftiness of the former and the consequence it entailed, as, for instance, the system of flying buttresses to resist the thrust of the vaults, and the suppression of the central tower. Whilst great external magnificence was thus attained, the English had as compensation a grander external effect in the triple towers of such cathedrals as Lincoln and Durham, and the crowning steeple of Salisbury. Owing to the lower elevation of the English vault, bringing it more within range of the eye, the English architect was induced to elaborate the groining; and from this had resulted the magnificent vaults of Exeter and King's College Chapel. Mr. Bidlake then compared the simple square ending of the English choir with its large window with the complex system of radiating chapels of the typical French choir; and concluded by a series of illustrations of the west fronts of the great French cathedrals with their marked triple portals. He allowed that while we in England had no triple doors to compare with France we had at least in Peterborough a façade which might console us for their absence.

---

[*] It will be observed that the 2 in the denominator of last fraction, line 3 below the diagrams, has dropped out.

Views and Reviews.

A Mechanical Engineer's Pocket Book.

The edition of this excellent pocket diary and year-book for 1907 contains all the good features of the former editions, while it has been improved in numerous directions. It has undergone a thorough revision, having been entirely re-set in new type. Some of the less important matter in previous editions has been condensed, and sections on subjects which call for fuller treatment have been enlarged. Among the new features which have been introduced we may mention a lengthy section on gas engines, which embodies a concise account of the design, construction and working of this type of internal combustion motor. A new section is also devoted to oil engines, while the growing importance of the subject has led to the introduction of a section on suction gas producers. Still another new section gives data and particulars of the construction of reverberatory furnaces, and there are other additions too numerous to mention. The book is a marvel of cheapness, and everyone in any way connected with mechanical engineering should get a copy every year.

The "Mechanical World" Pocket Diary and Year-Book for 1907. London and Manchester: Emmott & Company, Ltd., price 6d. nett.

Cheap Housing.

This book, which has been published by the Co-partnership Tenants' Housing Council, deals with the subject of garden villages. The Co-partnership Tenants' system is now being pushed, but it by no means offers such an ideal solution of all the problems in the regeneration of the working classes as its advocates would lead us to believe. It is true the tenant purchases a house in one way, but he never possesses the actual building as his own. He only purchases shares to the value of his house. The system, in fact, is an advanced socialistic one, and as such it is not generally approved. Of course, when schemes for the erection of villages are administered on the co-operative principle, we cannot expect a high standard of taste to prevail, and, consequently, the examples shown in this book of the houses which have been erected by the Ealing Tenants, Ltd., in that suburb of London, are not even innocuous: they are distinctly bad in design. Moreover, the illustrations shown of the work of the Ealing Guild of Handicraft, run in connection with this co-operative society, however praiseworthy they may seem to the zealous advocates of the system, unfortunately seem to us little removed from the worst period of taste in the Victorian era. It is a weary process waiting for the public to improve or help themselves, and we must think that greater progress would be made by the encouragement of individual enterprise, which would serve to educate more quickly the rank and file of the public. In this book there is an article by the architect responsible for the co-partnership housing scheme at Letchworth, Mr. Raymond Unwin, and there are numerous illustrations of his dispersed about the book. These designs are picturesque, but the picturesqueness is obtained at some cost, as well as sacrifice of space. The book, however, is in many ways most interesting and instructive and deserves to be widely read.

"Garden Suburbs, Villages, and Homes; all about Co-partnership Houses." London: Co-partnership Tenants' Housing Council, 22, Red Lion Square, W.C., price 6d. nett.

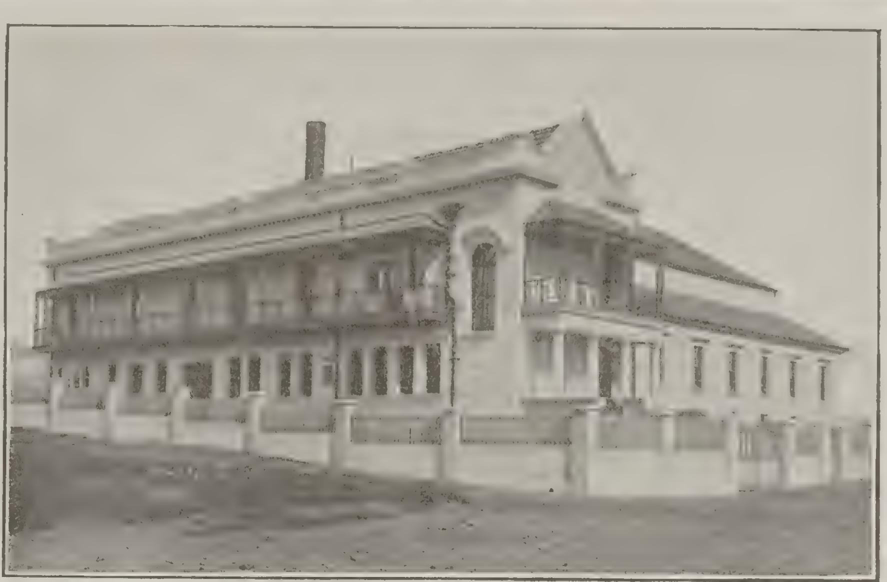
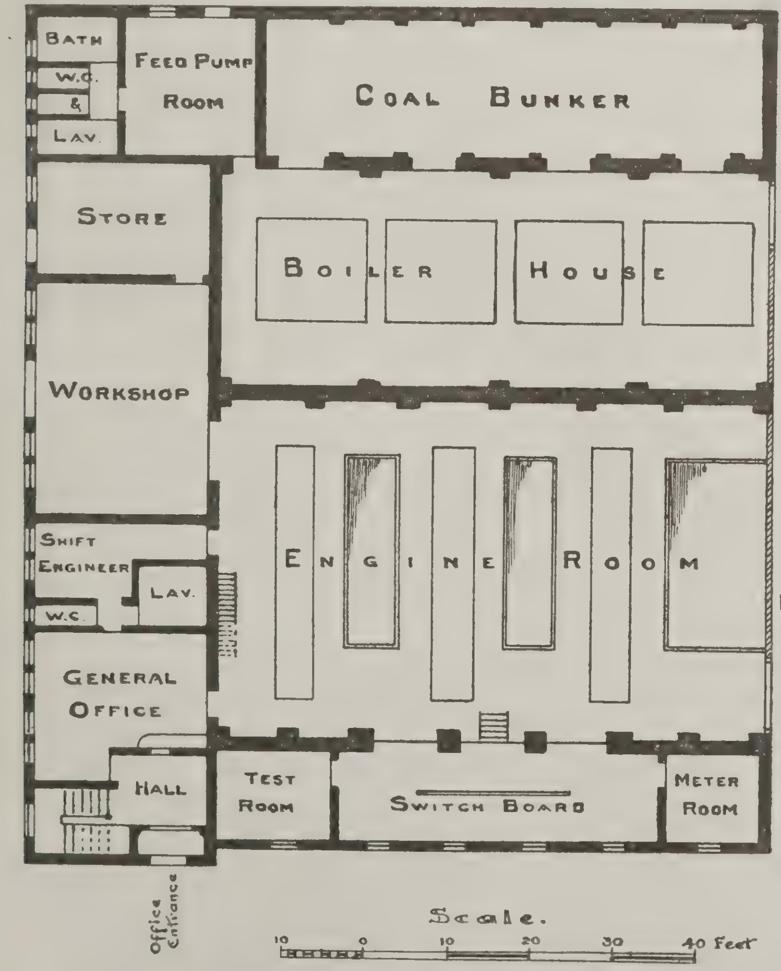
PORT ELIZABETH POWER STATION



ELECTRICITY GENERATING STATION, PORT ELIZABETH.
A. S. BUTTERWORTH, A.M.I.C.E., TOWN ENGINEER.

The accompanying photograph shows the new power station which has been completed this year at Port Elizabeth, South Africa. The general arrangement of the ground floor is shown by the plan. The upper floor of the office block contains the chief and assistant engineers' offices, and living-rooms for a portion of the staff. To the latter is due the comparatively rare feature of the balcony, which gives a somewhat unusual appearance to a "works" centre; the fact of the offices and living-rooms occupying such a prominent position has affected the general treatment and architectural character of the buildings to a considerable extent. Behind the main block is an accumulator house constructed of wood and iron, 60ft. by 26ft. Both engine-room and boiler-house are 66ft. long, 41ft. and 26ft. 6ins. in width, and 25ft. 6ins. and 27ft. in height respectively. The two are entirely disconnected, so that no coal dust can reach the machinery in the engine-room. These and the coal bunker can be extended indefinitely as required, the temporary end being so constructed that the existing portion will not be interfered with in the slightest degree. The railway siding is brought over the coal bunker to facilitate the emptying of the trucks. The walls of the engine-room and adjoining switchboard room are lined with white glazed bricks to heights of 9ft. and 5ft. respectively, relieved by coloured bands, skirting and moulded capping. At the level of the capping is the springing of the arches from the piers which carry the travelling crane girder. The floors of these rooms are paved with teak blocks of herring-bone pattern, a considerable portion overhanging the condenser pits, which are 8ft. deep. The doors in this part of the building are of oak, but the whole of the woodwork in the entrance hall is of teak, the floor being tiled. Although corrugated iron is the roofing material employed to cover the engine-room, boiler-house and coal bunker, the remaining portion of the main block is roofed with Bridgewater tiles (18ins. by 14ins.) which, together with the light stone-coloured tint with which the cement work is finished, gives a bright, pleasing appearance to the exterior, in keeping with the surroundings, which are not begrimed by the never-ceasing smoke that pollutes the atmosphere of so many English towns and cities.

The buildings have been designed and carried out under the supervision of the town engineer, Mr. A. S. Butterworth, A.M.I.C.E.; Mr. E. Grubb, as architectural assistant to the municipality, having had the actual superintendence of the works whilst in progress. The contractors were Messrs. Wills and Davey. The total cost has been about £11,000, inclusive of such external work as the formation of the railway embankment, siding, etc. Provision has been made for three 400 k.w. sets of turbo-generators and four marine-type tubular boilers with the attendant condensing plant, feed pumps, &c. The electrical portion of the undertaking has been carried out under the direction of the resident electrical engineer, Mr. R. Pape, A.M.I.E.E. The total outlay will amount to about £85,000.



PLAN OF PORT ELIZABETH ELECTRICITY GENERATING STATION.

Enquiries Answered.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional, or legal matters.

Correspondents are particularly requested to be as brief as possible.

The querist's name and address must always be given, not necessarily for publication.

Rolled Joist Questions at Examinations.

NEWPORT, MON.—STUDENT writes: "On page 91 of your issue of February 14th last, under the heading of "Distribution of Load on Girder," Professor Adams obtains the size of the joist by reference to maker's list. How should this question be worked out in the examination room?"

Examination questions involving the finding of the section of a rolled joist are always troublesome, partly because resistance to the bending moment is not assumed to be taken by the flanges alone, as in built-up girders, and partly because the standard dimensions cannot well be committed to memory. Approximate sections may be arrived at as follows:—Say the loading is such as to give a maximum bending moment (M) of 15 ton-ft.

on a span (L) of 10ft. A suitable depth of joist would be $d=\frac{L}{2}\times\frac{M}{L}=\frac{1}{2}M=\frac{1}{2}\times15=7{\cdot}5$in., say 8ins. for even measurement. Then $a=\frac{M}{{\cdot}78d}=\frac{15}{{\cdot}78\times8}=2{\cdot}4$ sq. in. area of flange. If the breadth of flange is six times the thickness divide the area by 6 and take square root for thickness, $\sqrt{\frac{2{\cdot}4}{6}}=\sqrt{{\cdot}4}={\cdot}633$, and width $={\cdot}633\times6=3{\cdot}798$, or guessing at the nearest stock size, say, 4ins. by $\frac{5}{8}$in. The weight in lbs. per foot run is about 12 times the area of flange in square inches, $2{\cdot}4\times12=28{\cdot}8$, say 29lbs. As $M=\frac{WL}{8}$, the bending moment of 15 ton-feet on a span of 10ft. would be given by a distributed load of $W=\frac{8M}{L}=\frac{8\times15}{10}=12$ tons. Turning to a catalogue the nearest section is 8in. by 4in. by 25lbs., and the safe load on a span of 10ft. is given as 13, 9, or 7 tons, according to the factor of safety. See "Designing Ironwork," 2nd Series, Part 4 (Spon, 2s). In the case referred to on p. 91, February 14, 1906, with a maximum bending moment of 18·75 ton-feet, $d=\frac{1}{2}M=\frac{18{\cdot}75}{2}=9{\cdot}375$, say 10in., $a=\frac{M}{{\cdot}78d}=\frac{18{\cdot}75}{{\cdot}78\times10}=2{\cdot}4$sq. in. This being the same area of flange as above the size of flange required will be about 4ins. by $\frac{5}{8}$in., and the whole weight in lbs. per foot run, say, 29lbs., making the proposed section 10ins. by 4ins. by 29lbs., while the British Standard section is 10in. by 5in. by 30lbs.

HENRY ADAMS.

Payment to Assistant during Examination.

LIVERPOOL.—A SUBSCRIBER writes: "Is it usual in the profession for an employer to continue to pay an assistant during a week's absence for purpose of examination?"

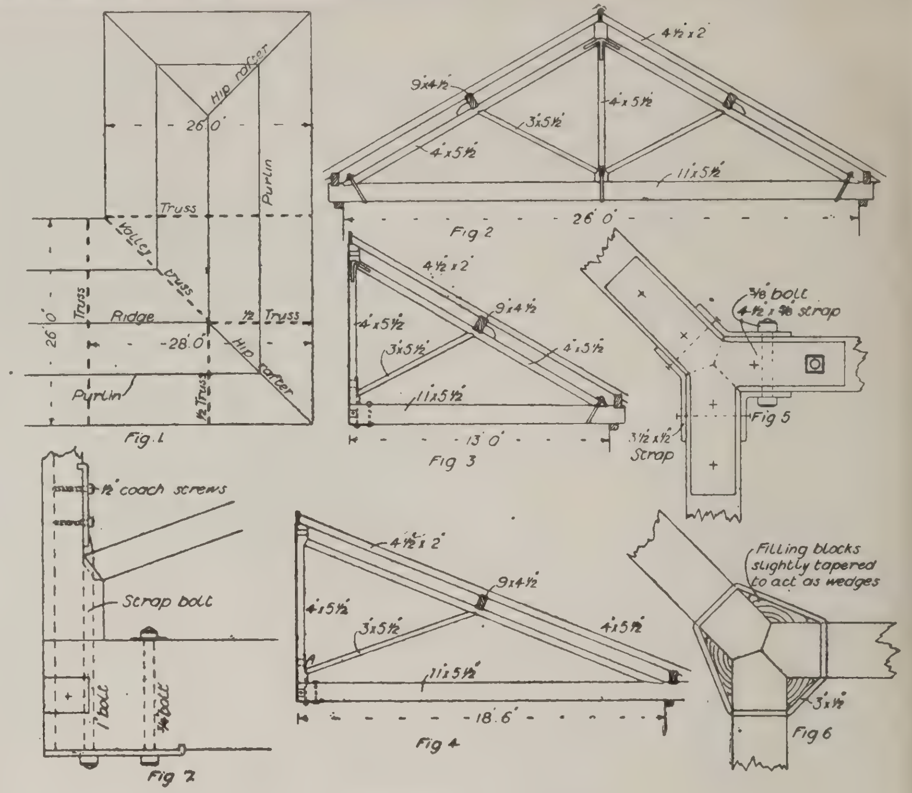
So far as we are aware, it is not.

Rights of Adjoining Owners.

Referring to the enquiry under this head on p. 288 of our issue for last week, A. H. writes: "If the buildings are in London, then, if a party wall had been raised by B, the London Building Act, 1894, would apply (see section 88 [6]), but since it would appear that B has built an external wall against A's external wall, not even that section will give any relief against the damage to the draught of A's chimney. The Prescription Act does *not* give A the right to passage of the smoke from his chimney over the land of B, except it has been so conducted over B's land in a confined channel or flue. A has obtained no right by user for his smoke to drift pathlessly over the land of A or any other of his neighbours. See *Bryant v. Lefever*, 4 C.P. Div. 172; *Webb v. Bird*, C.B.N.S. 284 and 841; and another case, *Bennett v. Hughes*, decided in July, 1886."

Arrangement of Trusses.

CARDIFF.—STUDENT writes: "The accompanying drawing shows half roof plan of a building. Kindly inform me how to deal with the portion of the roof between the two trusses shown. There are no supports under that portion."



ARRANGEMENT OF TRUSSES.

The plan of the junction of the two roofs is shown in Fig. 1 and the dotted lines show the proposed arrangement of trusses. The elevation of king-post truss for 26-ft. span is shown in Fig. 2, the elevation of one of the half trusses in Fig. 3, and of the valley truss in Fig. 4. The underside of the joint between the two half-trusses and valley truss is shown in Fig. 5, while Fig. 6 shows the joint at top of king-posts. An enlarged detail of joint A is shown in Fig. 7. The strap bolts to be 1in. diameter with 3ins. by ½in. strap. The other bolts ⅜in. diameter.

HENRY ADAMS.

Our Plate

The new Central Criminal Court.

The new Central Criminal Court in Old Bailey, which occupies the site of grim Newgate, is now complete, and only awaits official opening. Descriptions have been given in former issues of THE BUILDERS' JOURNAL, but in company with the general view of the building published as a centre plate in this issue we may give the following particulars:—The building is faced entirely with Portland stone, and the great dome which surmounts the whole group rises to a height of more than 200 feet, being crowned by a bronze-gilt figure of "Justice" by Mr. Pomeroy, who also is responsible for the sculpture work on the front to Old Bailey. Dignity and impressiveness have been considered of primary importance, and ornament has been sparingly used. The Newgate Street front is slightly curved, giving a pleasing effect of light and shade, and overcoming the difficulty of the awkward break in the building at this side. The main entrance in Old Bailey leads into a large hall with a wide corridor branching right and left, leading to various departmental rooms. From the entrance hall rises a fine marble staircase to the great hall on the first floor. This hall is the chief internal feature of the building. It is lined with magnificent slabs of marble and embellished with lunette paintings by Prof. Gerald Moira and Sir William Richmond. Following the plan of the ground floor, corridors, lined with marble, branch off on either side, and off these are the four courts—two large and two small, each with its own suite of rooms for counsel, jury, witnesses, &c.; the courts being top-lighted and panelled in oak, which is richly carved in parts.

The building is ventilated on Key's plenum system, the plant being one of the largest of its kind yet installed; it is capable of dealing with 20,000,000 cubic feet of air per hour.

The architect of the building is Mr. E. W. Mountford, F.R.I.B.A., of London, his design having been selected in competition in 1900. The general contractors were Messrs. Holloway Brothers. Among the sub-contractors were the following:—

Portland stone—Bath Stone Firms, Portland.
Ancaster stone — Thomson's Ancaster Quarries, Grantham.
Granite—J. Freeman & Co., Delauk Quarries, Cornwall, and Westminster.
Steel construction—Matthew, Shaw & Co., London; Dorman, Long & Co., Middlesbro'; Horsley Iron Co., Staffordshire; Redpath, Brown & Co., Edinburgh.
Marble wall linings, columns, &c., A. Lee & Bros, Hayes.
Marble staircase and floors—Anselm, Odling & Sons, London.
Scagliola columns—Bellman, Ivey & Carter, London.
Mosaic floors and ceilings—Rust's Vitreous Mosaic Co., London.
Tile wall linings and dadoes—Doulton & Co., London.
Heating and ventilation, William Key, Glasgow.
Hot-water drains—Wenham & Waters, Croydon.
Sanitary fittings—Doulton & Co., London.
Ironmongery—Carter & Aynsley, London.
Lead lights—Henry Hope & Sons, Birmingham.
Fibrous plaster and carving—Gilbert Seale, London
Bronze castings—J. W. Singer & Sons, Frome.
Cell fittings—C. Smith, Sons & Co., Birmingham.
Electric-light work and gas—H. J. Cash & Co. London.
Copper work—Braby & Co., London.
Lifts—Waygood & Co., London.
Court furniture—Hampton & Co., London.
Asphalting—Limmer Asphalte Co., London.

Working drawings of the building were reproduced in "Specification, 1906."

We think it will be generally admitte that Mr. Mountford has achieved a grea success in this noble building.

R.I.B.A. NOVEMBER EXAMS.

The following is the pass list for the November examinations of the Royal Institute of British Architects:—

The Preliminary Examination,

qualifying for registration as *Probationer R.I.B.A.*, was held in London and the provincial centres mentioned below on November 5th and 6th. 188 candidates were admitted, and 57 exempted. The remaining 131 were examined, with the following results:—

	Number Examined	Passed	Relegated
London	62	44	18
Birmingham	7	6	1
Bristol	8	5	3
Cardiff	6	5	1
Leeds	16	9	7
Manchester	20	13	7
Newcastle	12	9	3
	131	91	40

The passed candidates, with those exempted—making a total of 148—are as follows:—

J. B. Adams (Hanley)
P. J. Adams (Buckhurst Hill)
H. A. Ashford (Hoddesdon)
G. W. Bacon (Croydon)
G. F. Barker (Birmingham)
A. C. Beesley (Sheffield)
H. S. Besant (London)
F. Blake (London)
C. F. Boniface (Petersfield)
F. A. Brewerton (Manchester)
H. Brewis (London)
W. Burn (Rangoon, Burma)
P. N. Bushell (Birmingham)
E. H. Butcher (Standford-le-Hope)
D. A. Campbell (Liverpool)
P. J. Carey (Bromley)
W. D. Cathcart (London)
H. B. Cawthorne (Mexborough)
H. S. Chamberlain (Southsea)
T. C. Chamberlain (London)
H. F. Chandler (London)
G. D. Channon (Malton)
W. A. Cheers (Twickenham)
G. Cheesewright (Rotherham)
W. G. L. Cheriton (London)
S. Clark (Carlisle)
W. Clough, jun. (Keighley)
H. B. Coates (Altofts)
W. V. Coates (Grimsby)
B. P. Collin (Andover)
H. T. Cook (Chingford)
A. E. Cornell (Birmingham)
M. J. Cox (Godalming)
E. Crellin (Ramsey, I. M.)
H. W. Cruickshank (Aberdeen)
J. G. Dalziel (West Hartlepool)
O. F. Davidson (Newcastle-on-Tyne)
W. F. Davies (Chester)
O. R. Davis (London)
P. W. Davis (London)
W. W. Diggle (London)
W. R. Eckersley (Carlisle)
A. L. Edwards (London)
R. E. Eiloart (London)
A C. Farmer (Birkenhead)
G. H. Fawcett (Scarboro')
J. H. Fletcher (Hyde)
H. C. Fowler (Ryde, I.W.)
S. C. Garrett (Brighton)
J. D. Grant (Inverness)
B. Greenall (Manchester)
H. Gresswell (London)
C. T. Hall (Cardiff)
R. B. Hall (Batley)
J. J. Harries (Swansea)
L. Y. Harris (Nottingham)
J. A. Howell (Oxford)
F. Howorth (St. Anne's-on-Sea)
S. G. W. Hunt (Brighton)
D. F. Ingleton (Cardiff)
G. W. Jack (London)
J. H. Jackson (Leeds)
E. G. Jenkins (London)
S. Johnson (Birmingham)
W. S. Jones (London)
L. C. B. Joynson (Wednesbury)
H. Kelly (Carlisle)
H. F. King (London)
B. Knowles (Bootle)
I. T. Lawrence (Rhondda)
W. Lawson (Gateshead)
W. H. Letheren (Fareham)
P. H. Lomax (Bolton)
F. Lorn (Falkirk)
E. Loveluck (Bridgend)
M. Lyon (Birkenhead)
A. Lyth (Burslem)
G. G. Macfarlane (Glasgow)
R. MacKenzie (Lochlinchart)
C. McLachlan (London)
N. A. D. Maclean (Gaurock)
W.W. McNeil (Blackburn)
W. A. Malone (Belfast)
C. W. Marles (Sketty)
H. C. Marshall (Sunderland)
H. W. Martindale (Bournemouth)
L. D. Martyn (Tiverton)
S. P. Mather (Mill Hill)
J. R. Maughan (Hexham-on-Tyne)
G. M. Mayhew (Hitchin)
L. E. Montenius (London)
J. Moodie (Goodmayes)
H. B. T. Morgan (London)
H. H. Morley (London)
H. F. Mott (Plymouth)
H. M. Nash (Farnham)
F. B. Nightingale (London)
V. O'Dwyer (Leeds)
R. Ordish (Derby)
P. P. Patey (Hereford)
H. R. Peerless (Reigate)
P. Pell-Ilderton (Manchester)
A. V. Pusill (Llandudno)
H. O. M. Pym (Nottingham)
J. Quekett (Dublin)
M. Ravenscroft (Oxton)
A. H. Rayment (London)
A. Revie (Airdrie)
W, Rhind (London)
F. A. Richards (London)
B. W. Ridley (Nottingham)
G.W. Ridley (Nottingham)
R. P. Rosling (Bristol)
R. T. Russell (London)
W. A. Rutter (Cardiff)
H. S. Sawyer (Carlisle)
J. Seddon (Thornton Heath)
H. P. Shapland (London)
R. Shears (Westcliff-on-Sea)
H. W. Sheffield (Earls Barton)
H. J. Shepherd (Sheffield)
C. T. Sherwin (Stafford)
W. J. Smith (Newcastle-upon-Tyne)
G. M. Stewart (Glasgow)
J. T. Stone (London)
A. D. Stuart (London)
J. Sutcliffe (St. Anne's-on-Sea)
E. Swann-Watts (St. Anne's-on-Sea)
W. E. Sykes (Cottingham)
F. Tapping (Aylesbury)
H. A. Thomerson (London)
L. Tigar (Southampton)
T. E. Turner (Solihull)
M. T. Violet (Stafford)
F. Waldrow (Enfield)
R. L. Wall (Upper Tooting)
A. G. Waller (London)
T. W. Waller (Birmingham)
H. A. Welch (London)

E. W. Willcox (Bristol)
E. Williams (Swansea)
S. Williams (London)
W. E. Willis (Bristol)
J. Wilson (London)
D. C. Winter (Westcliffe-on-Sea)
A. Wintle (Twickenham)
T. Wrigley (St. Anne's-on-Sea)

The Intermediate Examination

qualifying for registration as *Student R.I.B.A.* was held in London and the undermentioned provincial centres on November 5th, 6th, 8th, and 9th. 144 candidates presented themselves and were examined, with the following results:—

	Number Examined	Passed	Relegated
London	93	40	53
Bristol	13	8	5
Dublin	2	2	0
Leeds	13	5	8
Manchester	16	7	9
Newcastle	7	3	4
	144	65	79

The 65 successful candidates have been registered as *Students R.I.B.A.* Their names, which follow, are given in order of merit, as placed by the Board of Examiners:—

D. W. Ayre (Cork)
S. H, H. Ixer (London)
J. L. Denman (Brighton)
H. Boddington (Wilmslow)
E. R. Green (London)
S. A. Neave (London)
C. R. Merrison (London)
G. E. Hunter (Gosforth)
E. W. Wray (London)
W. R. Mann (Leicester)
D. N. Dyke (London)
J. B. Richardson (Shotley Bridge)
A. R. Widdowson (Leicester)
H. W. Hallas (Huddersfield)
F. L. W. Cloux (London)
F. H. Healey (Bradford)
F. C. Mason (London)
W. H. Louw (Paarl, Cape Colony)
H. Savage (London)
J. G. Martin (Oldham)
J. A. Davidson (Co. Down)
G. B. Selleck (Plymouth)
O. White (Birmingham)
A. G. Warnham-Tickle (London)
F. H. Brazier (Addlestone)
H. S. Fleming (Erith)
A. W. Fulton (Liverpool)
W. T. Higgins (Stony Stratford)
F. E. S. Munt (London)
E. J. E. Moore (Newport, Mon.)
J. G. Allen (London)
R. F. Bargman (London)
R. H. P. Bevis (London)
A. H. Boss (London)
H. H. Christie (Liverpool)
F. W. Commin (Exeter)
H. Edmonds (Kidderminster
W. Goodchild (Ipswich)
C. F. Gurney (Leeds)
E. H. Hawkins (London)
N. Heppenstall (Milnsbridge)
G. Hollins jun. (Newcastle, Staffs)
R. J. Hughes (Tonypandy)
C. M. Jones (Swindon)
H. F. Kohler (London)
G, E. G. Leith (London)
C. J. Mole (Plymouth)
D. H. Morgan (Aberdare)
A. S. Padfield (Cardiff)
H. W. Parnacott (London)
T. L. Pearce (London)
A. J. Perren (London)
N. A. Rew (Great Berkhamsted)
A. K. Robertson (Edinburgh)
B. Robson (Scarborough)
D. G. J. Saw (London)
E. D. Sherlock (Manchester)
L. A. D. Shiner (Grays)
R. G. P. Smith (Reading)
E. A. Taylor (London)
A. Walmsley (Haslingden)
J. L. Warry (London)
H. West (London)
J. E. Whitehead (Sheffield)
J. H. Wyeth (Epsom)

Exemptions from the Intermediate Examination.

In accordance with the new regulations, the following Probationers, possessing Degrees or Certificates, were exempted by the Council from sitting for the Intermediate Examination, and have been admitted as *Students R.I.B.A.*:—

L. K. Adams (Birkdale)
H. Berton-Benjamin (London)
B. H. Collcutt (London)
B. M. Goodwin (Croydon)
H. B. T. Morgan (London)
H. H. Scott-Willey (Reigate)
F. Thorp (Southport)
A. Welford (London)

The Final and Special Examination

was held in London from November 15th to 23rd, with an interval of one day between the Written and Oral Examination. Of the 90 candidates examined, 50 passed, and 40 were relegated in various subjects. The following are the names of the 50 passed candidates, the * against a name signifying that the candidate entered for the Special Examination designed for architects in practice and chief assistants exempted by the Council from the Preliminary and Intermediate Examinations and from submitting Testimonies of Study:—

A. J. T. Abel (Tooting)
*W. T. Armstrong (Lancaster)
T. S, Attlee (Putney)
G. S. H. Bradford (London)
E. B. Crossley (Nottingham)
T. L. Dale (London)
H. A. Dalrymple (Grays)
N. J. Dawson (Chelmsford)
*A. C. Denny (Dumbarton)
C. M. Drewitt (Southport)
P. M. Fraser (London)
J. T. Halliday (Southport)
J. H. Hargreaves (Manchester)
D. P. Hayworth (London)
J. R. Hobson (New Eltham)
W. A. Hodges (London)
J. N. Horsfield (London)
C. E. Howitt (Nottingham)
S. Jaques (London)
N. Jones (Southport)
P. H. Keys (London)
H. Langman (Southport)
L, A. Loades (Morpeth)
R. A. Loveitt (Dartford)
C. E. Lovell (Gravesend)
W. G. Milburn (London)
A. S. Millar (London)
P. Minor (Manchester)
*C. L. T. Morgan (London)
*A. E Munby (London)
N. T. Myers (Watford)
G. Nott (Leicester)
C. H. Perkins (Carlisle)
A. P. H. Pierce (London)
*J. C. Reid (Glasgow)
H. P. Roberts (Horsham)
*P, T. Runton (Hull)
*W. T. Sadler (London)
I. F. Sifton (London)
J. Myrtle Smith (London)
A. K. Tasker (North Shields)
D. L. Solomon (London)
R. W. Thorp (London)
F. J. Toop (London)
J. I. Tweedie (Annan)
C. P. Wade (Yoxford)
F. Wade (Bradford)
S. J. Wearing (Leicester)
A. F. Wickenden (Maidstone)
W. B. Wyllie (London)

The following table shows the number of failures in each subject among the forty relegated candidates in the Final Examination:—

I.	Design	30
II.	Mouldings and Ornaments	24
III.	Building Materials	13
IV.	Principles of Hygiene	17
V.	Specifications	13
VI.	Construction, *Foundations, &c.*	15
VII.	Construction, *Iron and Steel, &c.*	21

The Ashpital Prize.

On the recommendation of the Board of Examiners the Council propose to award the Ashpital Prize to Mr. James Theodore Halliday, of Stockport, "as having most highly distinguished himself" in the current year's Examinations.

Obituary

Mr. James Perry, county surveyor, of Galway, died recently, aged 61. He had been an examiner in building construction for South Kensington and contributed the articles on these examinations which appeared in our columns some time ago. He was a very able engineer, possessing considerable scientific attainments. His brother is Prof. John Perry, the well-known electrician and professor of the Royal College of Science.

The Strand Improvement Scheme.—The London County Council discussed at its meeting last week the suggestions of the further Strand Improvement Committee for altering the line of frontage of the northern side of the Strand between Wellington Street and St. Clement Danes. An amendment was brought forward to defer to the opinion of the many eminent architects, artists and others who had supported the proposal, but the Council rejected this, and adopted, by a large majority, the recommendation of its Improvements Committee not to alter the present arrangement.

Modern Buildings with Steel Construction—A paper on this subject was read by Mr. John Bowman before the Glasgow Technical College Architectural Craftsmen's Society on November 30th. Mr. Bowman dealt more particularly with the erection of the Edinburgh Life Assurance Co.'s building in St. Vincent Street, Glasgow (see our issue for November 28th). The architect of this building was Mr. John A. Campbell, I.A., F.R.I.B.A., with whom Mr. Bowman has been clerk of works for many years. The lecturer described in detail the foundations of the various steel-built columns which carry the entire building, eight storeys in height. About two-thirds of these columns go down to solid rock, the remainder being carried by reinforced concrete foundations 12ft. wide by 4ft. thick (or deep) over blue clay. Mr. Bowman afterwards dealt with the steel framing of the building. Fire-resisting construction was adopted throughout, the columns being encased in brickwork built in cement, and the girders in cement concrete. The floors and roof—which is flat—are of patent tubular fire-resisting construction.

Notes on Competitions

High School for Girls, Liscard.

Designs for this school are being invited in competition from a limited number of local architects who have had experience in school planning. A competent assessor will be appointed.

Rebuilding of Henshaw's Blind Asylum, Old Trafford, Manchester.

About twenty designs have been submitted in this competition, which is limited to Manchester architects. The assessor is Mr. John Holden, F.R.I.B.A., and his awards will be made known some time this month.

High School for Girls, Barnsley.

The forty-nine architects from various parts of the country who were specially invited have now submitted their designs for the above school. The assessor is Mr. E. R. Robson, of London.

Proposed Central Library, Birkenhead.

A competition is to be held for this building. It will be limited to architects resident or in practice in Birkenhead.

The New County Hall.

In a letter to the *Standard*, commenting on the report of the London County Council proceedings in regard to the new County Hall at last week's meeting, Mr. Horace T. Bonner, A.R.I.B.A., says: "With regard to the statement by Mr. Cleland, M.P., that he hoped to be able to bring up in a fortnight's time the names of the architects selected to prepare competitive designs, I have to say that inasmuch as this is a public competition—open to all the world—and as the conditions even of the competition will not be ready (according to a reply to my inquiry from the clerk to the Council) until early in 1907, I cannot understand how, or why, any architect should be now 'selected.' If any is so 'selected' immediately, it will be a manifest injustice to the other competitors who are to be invited by public advertisement. Any one being now selected means having the advantage of many extra months of study, and, possibly, earlier information in an underground way of the Council's requirements. Let every London architect protest against this unfairness."

Bangor University College.

The designs for new buildings at Bangor University College submitted by four of the five architects invited to compete were assessed by Sir Aston Webb last week. The fifth competitor did not send in a design.

Princes Street Promenade, Edinburgh.

The Princes Street promenade proposal at Edinburgh has come in for strong criticism and objection on the part of the Council of the Cockburn Association, who are averse to the present scheme being proceeded with and suggest that, in any case, if the idea is to be carried out, there shall be an open competition for the design.

Perth City Hall.

The Perth Town Council made another attempt last week to solve the apparently never-ending problem of the City Hall. At a former meeting the Council by 11 votes to 3 (12 declining to vote) adopted design No. 2, by Messrs. Menart & Jarvie, of Perth, the minority being in favour of design No. 1, that of Mr. Sibbald, Dundee. It will be remembered that Mr. Burnet, the assessor, awarded first place to Mr. Sibbald's design for reconstruction. At last week's meeting Dean of Guild Barlas moved that design No. 2 (by Messrs. Menart & Jarvie) be adopted, and Councillor Thomson seconded. Councillor Rollo, who moved that Mr. Sibbald's plan of reconstruction be approved, said the Council had paid £50 to the assessor, who was better qualified to know which was the better plan. Councillor Calderwood seconded. On a vote, 10 voted for design No. 2 and 3 for design No. 1, 11 declining to vote.

List of Competitions Open.

Deposit for conditions given where known.

DATE OF DELIVERY	COMPETITION.
Dec. 31	LABOURERS' COTTAGES AT DUBLIN.—Premiums of £50, £30 and £20. Particulars from A. R. Barlas, secretary, L.G.B. Offices, Dublin. No deposit.
Dec. 31	DUAL SECONDARY SCHOOL AT GOOLE.—Premiums £50 and £25. Particulars from James W. Johnson, clerk to Governors, Council Offices, Goole. Deposit £2 2s.
Dec. 31	NURSES' HOME AT GENERAL HOSPITAL, WOLVERHAMPTON.—Particulars from J. Stephen Neil, House Governor and Secretary, General Hospital, Wolverhampton. No deposit.
Dec. 31	BATHS AT ASHTON-IN-MAKERFIELD.—Limited to architects in Wigan and Leigh Poor Law Unions. Particulars from A. Sykes, clerk, Council Offices, Ashton-in-Makerfield. No deposit.
1907 Jan. 12	LAY-OUT OF RIDDRIE ESTATE, GLASGOW.—Premiums of £75, £50 and £25. Particulars from A. W. Myles, town clerk, City Chambers, Glasgow. No deposit.
Jan. 19	LIBRARY AT PLYMOUTH.—Premiums £50, £30 and £20. MUSEUM AND ART GALLERY AT PLYMOUTH. Premiums £25, £20 and £10. Limited to local architects. Particulars from Borough Librarian, Plymouth.
Feb. 1	CHILDREN'S HOSPITAL AT SUNDERLAND.—Premiums of £100, £50 and £25. Particulars from T. Robinson, secretary, Infirmary Offices, Bank Buildings, Sunderland. Deposit £1 1s.
No date.	CONGREGATIONAL CHURCH, SCHOOL AND MANSE, GRIMSBY.—To cost £8,200. Premiums of 25, 15 and 10 guineas. Particulars from E. L. Bridge, Fish Docks, Grimsby. Deposit £2 2s.

ANOTHER COTTAGE EXHIBITION.

A Model Cottage Exhibition is to be held next year at Walker, Newcastle-on-Tyne, under the auspices of the National Housing Reform Council. It is hoped to open the Exhibition in June. There will be three classes of cottages, namely:—

(*a*) Cottages with large living-room, 2 bedrooms and scullery, with bath, to cost £185;

(*b*) cottages with large living-room, 3 bedrooms and scullery, with bath, to cost £225;

(*c*) cottages with large living-room, parlour, 3 bedrooms and scullery, with bath, to cost £250;

the cost in each case to include architect's fees and builder's profits, but not land nor roads.

There will also be a special class of cottages for young married people or aged people, these cottages to cost £150, and to contain living-room, bedroom and scullery, with bath.

For the planning of the site on model lines there will be a preliminary competition. The average number of houses will be 12 to the acre, so as to secure good garden space to each cottage.

Furniture and gardening competitions will be arranged, and there will be an exhibition of building materials.

The awards, instead of being money prizes (which the promoters do not consider to be the most satisfactory method), will be in the form of gold, silver and bronze medals, with a limited number of diplomas.

With regard to the cost of the cottages, bearing in mind the dissatisfaction expressed by some visitors at the Letchworth exhibition, the promoters have decided to make it a condition that exhibitors, if called upon, shall sell the cottages erected to the Housing Committee of the Newcastle City Council at the price stated in the catalogue, and also, if called upon to do so, shall build for the Housing Committee on the adjoining estate not more than 12 cottages at the stated price. A fee of two guineas per cottage will be charged to exhibitors, while the entrance fee for the exhibition planning competition will be 10s. 6d.

The by-laws under which the cottages will be erected are those of the Newcastle City Council, and copies of these will be sent to all competitors. They are among the most stringent in the North of England, and therefore the cost of cottages built under them will be a representative cost throughout the districts which the exhibition will serve.

IN PARLIAMENT.

(By our Press Gallery Representative.)

Norwegian Granite in Public Works.

Mr. Hugh Law asked the President of the Local Government Board whether he was aware that some local authorities were accustomed to specify Norwegian granite for use in public works under their control; and whether, in view of the existence of undeveloped quarries of suitable granite in Great Britain and in Ireland, he would circularise local authorities and point out the undesirability of giving this undue preference to foreign quarry owners.

Mr. John Burns replied that he understood that in some localities Norwegian granite was cheaper than other similar stone, and he presumed it was upon this ground that some local authorities preferred to use it. He could not undertake to interfere with the exercise of their discretion in the matter.

The Scottish Laws Courts.

Replying to Mr. Charles E. Price, respecting the proposed alterations at the Scottish Law Courts in Edinburgh, Mr. Harcourt, First Commissioner of Works, said that certain plans had been prepared which had been seen by the Faculty of Advocates and altered to meet their views. They were under the most careful consideration, but at this moment he was not able to make a more definite announcement.

Irish Buildings.

The Commissioners of Public Works in Ireland, in their annual report dated July 28th, 1906, just issued, state that the whole of the plans for the new Royal College of Science for Ireland have been completed and are in the hands of the quantity surveyors.

The new buildings in connection with Queen's College, Belfast, have been erected as a continuation of the northern wing of the College, and are now nearly complete.

At forty ancient monuments repairs had been carried out—in particular at Holy Cross Abbey.

Electrical Notes.

Steel Conduits for Electric Wiring.

The use of steel conduits for electric wiring has now become so general that the cumbersome old wood casing is fast disappearing. The new system has a great many points in its favour, not the least being the rapidity with which it enables work to be executed, the excellent insulation it provides, the protection assured against injury and fire, and the accessibility for inspection which is possible with this system; it is also very neat in appearance. Among firms who have made a speciality of this class of work are Messrs. Strode & Co., of Osnaburgh Street, Regent's Park, N.W. During the past few years they have carried out a great number of important installations, and in the course of their experience have introduced many improvements in fittings. One of their most important installations is at the Savoy Hotel, where there are more than 50 miles of steel conduit. They also did the whole of the electric wiring, bells and telephones at the new Naval College at Dartmouth. Messrs. Strode are also putting in their installation into the new "Morning Post" building.

A new Wall Plug.

A particularly neat wall and skirting-board socket and plug has just been brought out by the Edison and Swan United Electric Light Co., Ltd. Its special feature is that, instead of the whole fitting protruding at right angles to the base, like the older-fashioned plugs, this new fitting is so arranged that the plug fits into its socket parallel to the wall, and thus has a very much neater appearance: moreover, it is not so liable to damage as the older type. The plug is of strong ebonite, with a highly-efficient grip arrangement for the cord, and the socket may be obtained in three different varieties—namely, in plain porcelain without cover, with cover, and with cover and lid. The fitting is very well finished, and is probably the most efficient socket on the market from the point of view of insulation, being made of highly-glazed porcelain, with the contracts sunk to prevent the possibility of short-circuiting. The fitting is enclosed in a metal cover adapted for easy fixing, and the hinged metal lid with which it can be fitted can be pushed over to cover the terminals when the plug is withdrawn.

The new Power Station at Greenwich.

The new electricity generating station at Greenwich for the London County Council tramways will be a very large installation when complete. The total estimated cost is put at £900,000. At present only half the station is built. There are twenty-four 5-drum Stirling boilers of 200lbs. pressure, and four steam generating sets of 3,500kw. capacity each. These generators are of revolving field type delivering 3-phase current at 6,600 volts between phases, 25 cycles per second. Provision is made for eight generators and thirty-two feeders. For the second portion of the station it is proposed to use turbo-generators of a total capacity of 20,000kw. The sub-station contains three motor-generators of 500kw. capacity, supplying direct current at 550 volts. There is a battery of 280 Tudor cells. Coal for the station can be landed from a pier at the rate of 1,000 tons per day, electric coal-handling machinery being provided.

A new London "Tube."

The newest electric "tube" railway in London is the Great Northern, Piccadilly and Brompton, which extends from Hammersmith, through Earl's Court, South Kensington, Hyde Park Corner, Piccadilly Circus, Covent Garden, Holborn, Russell Square, King's cross, Caledonian Road, Holloway Road, to Finsbury Park. A feature of the line is the double spiral electric moving track at Holloway Road station: this travels at the rate of 100ft. per minute and will take passengers up and down simultaneously, being fitted in lieu of lifts.

Institution of Electrical Engineers.

The 18th annual dinner of the Institution of Electrical Engineers was held last week. Dr. R. T. Glazebrook, F.R.S., the president, occupied the chair. Mr. Babington Smith, in proposing the toast of the institution, said that with the prospects of advance and development in all branches of electrical science which lay before them, he thought he could predict a prosperous future for the institution. The president, in responding, said the institution had among its leaders many great engineers, who recognised the debt they owed to other distinguished members of the institution, sometimes called the professors. It seemed to him that the progress of the institution had been great and rapid because it had known how to combine in due proportion the efforts of both those classes.

THERE ARE THINGS ONE CANNOT FORGET!

One of them is this:

"ROYAL EDISWAN"

ELECTRIC LAMPS

are the Best and Cheapest in the end.

NOTE.

THE FOLLOWING IS A RECENT EXTRACT FROM THE "ELECTRICAL REVIEW."

EDISWAN LAMPS.—In connection with the independent tests just concluded by the Westminster Electrical Testing Laboratory, York Street, Westminster, we understand that the "Royal Ediswan" Lamp comes out at the top of the list. The mean results of all the lamps tested show that this well-known lamp gives the best results under all headings, such as regularity of manufacture, life, and last, but not least, economy in watts per candle-power.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that **readers will find particulars in our previous issues of other contracts that still remain open.**

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Dec. 14. Launceston.—*Erection of a drill hall* at Launceston. The plans, specifications and conditions may be seen at the office of O. B. Peter, architect, Launceston, to whom sealed and endorsed tenders should be sent on or before Dec. 14.

Dec. 14. Cork.—*Making, supplying, and fixing benches* in City Hall, Albert Quay, Cork, in strict accordance with the plan, specification, and conditions of contract prepared by the City Engineer. General conditions, specification, and drawings can be seen in the City Engineer's Office, City Hall, from 10 to 4 daily, where tender forms will be issued. Intending contractors must first lodge with the City Treasurer the sum of £1. Fair wages clause. Sealed proposals, endorsed "Tender for Benches for City Hall," must be deposited with F. W. M'Carthy, town clerk, City Hall, before 2 p.m. on Dec. 14. Irish materials must, as far as practicable, be used in the execution of the work.

Dec. 17. Blackpool.—*Alterations and extensions* to Police Station, South Shore, for the Watch Committee, in acordance with plans, which can be seen, and copies of specifications and bills of quantities, which can be obtained, on application to J. S. Brodie, borough surveyor, Town Hall, Blackpool, and on a deposit of 10s. 6d. Sealed tenders, addressed to the Chairman of the Watch Committee, care of J. S. Brodie, endorsed "South Shore Police Station," should be delivered not later than 10 a.m. on Dec. 17.

Dec. 17. Rustington.—*Erection of two cottages*, at Rustington, Sussex, according to the plans and specifications prepared by H. G. Heal, surveyor, Worthing and Littlehampton, which can be seen at the offices of E. B. Wannop, Esq., solicitor, Littlehampton, daily, except Saturday, between the hours of 10 and 4. Sealed tenders must be delivered before 4 p.m. on Dec. 17.

Dec. 19. Kington.—*Additions and alterations to* the Lady Hawkins' Grammar School. The works comprise two new class-rooms, cloak-rooms, offices, and a workshop, and certain consequential alterations. Plans and specifications of the proposed works can be seen at the School House daily between 10 a.m. and 4 p.m., and bills of quantities and form of tender can be obtained on application to A. Dryland, Shirehall, Hereford, upon the payment of a deposit of £2 2s. Sealed tenders, endorsed "Tender for Alterations," must reach T. Mahir, clerk to the governors, Grammar School, Kington, before 10 a.m. on Dec. 19.

Dec. 19. Scalby.—*Rebuilding and widening* of Newby Bridge (stone), at Scalby, near Scarborough, on the Whitby and Scarborough main road. Contractors desirous of tendering may see the plans and specification and obtain bills of quantities at the County Surveyor's Office, County Hall, Northallerton, until Dec. 19, between 9.30 a.m. and 4 p.m., Saturday, until 12 noon.

Dec. 19. Maldon.—*Deepening a well* at the Wantz Road Pumping Station, for the Town Council. Plan and specification may be seen at the office of T. R. Swales, borough surveyor, London Road, Maldon. Tenders, endorsed "Tender for Well," to be delivered to F. H. Bright, town clerk, Town Clerk's Office, High Street, Maldon, on or before Dec. 19.

Dec. 21. Belfast.—*Providing and erecting additional fencing* at Carmoney New Burial Ground, in accordance with plan and specification, which may be seen of J. W. Robb, clerk to Belfast Burial District Council, Clerk's Office, Union Workhouse. Sealed tenders to be lodged with him not later that 12 noon on Dec 21.

Dec. 22. Burnley.—*Erection of proposed technical school* in Omerod Road, Burnley, for the Education Committee. Drawings may be seen and specifications, bills of quantities, and forms of tender obtained at the office of the Borough Engineer, G. H. Pickles, A.M.I.C.E., on payment of £1 1s. Tenders endorsed "Wagon Shed," to be delivered and addressed to the Chairman of the Education Committee, must be delivered at the Town Clerk's Office, Town Hall, not later than 9 a.m. on Dec. 22.

Dec. 22. Callington.—*Erection of a new secondary school* at Callington, for the Cornwall Education Committee, according to plans and specifications which may be seen at the office of J. Sansom, architect to the Committee, Liskeard, from whom all particulars relating to the work may be obtained. Sealed, endorsed tenders on official forms, which may be had from the architect, are to be sent to F. R. Pascoe, secretary, Education Office, Truro, on or before Dec. 22.

Dec. 28. Hove.—*Erection of public library* in Church Road, Hove, in accordance with plans, specification and bill of quantities prepared by the architects, P. Robinson, F.R.I.B.A., and W. Alban Jones, of Yorkshire Post Chambers, Leeds. Plans and specification may be seen and bills of quantities, at the office of H. H. Scott, borough surveyor, on payment of £1 1s. Tenders, on forms supplied, endorsed "Tender for Erecting Proposed Library," addressed to H. Endacott, town clerk, Town Hall, Hove, will be received up to 6 p.m. on Dec. 28.

Dec. 31. London, S.E.—*Erection of a branch library* at Hither Green S.E. The drawings and specifications of the building can be inspected either at the offices of H. Hopton, architect, 37, Ringstead Road, Catford, S.E., or of C. O. Robson, quantity surveyor, 33, King Street, Cheapside, between 10 and 4. A copy of the quantities can be obtained at the office of the quantity surveyor on payment of £2 2s. Sealed tenders, accompanied by the priced bills of quantities (also sealed), and addressed to the Clerk to the Committee, are to be delivered at the Town Hall, Catford, on or before Dec. 31. Fair wages clause.

Jan. 15. Enfield.—*Erection of a junior mixed school* at Bush Hill Park, Enfield. Applications for bills of quantities should be sent to G. E. T. Laurence, architect, 22, Buckingham Street, Adelphi, W.C., before Dec. 29, from which date the plans and specification can be seen at the above address. A deposit of £1 1s. should accompany the application. Sealed tenders, on the form supplied, must be delivered to N. Hepworth, clerk, Public Offices, Enfield, free of charge, not later than 12 noon on Jan. 15. The contractor whose tender is accepted will be required to enter into a bond with two sureties in the sum of £200 each for the due performance of the contract.

April 2. Bombay.—*Construction of a reclamation* between Mazagon and Sewri, for the Trustees of the Port of Bombay. The contract will include the building of a rubble masonry quay wall about 12,600ft. long on piled foundations and the reclamation of about 518 acres of the foreshore; such reclamation to be effected by silt or mud pumped or dredged from the bed of the harbour, and covered with a layer of good earth. Copies of the specifications and drawings of the work can be obtained from the Chief Engineer, Bombay Port Trust, Ballard Road, Bombay, or from Sir J. Wolfe Barry and A. J. Barry, trustee's consulting engineers, 7, The Sanctuary, Westminster, S.W., on payment of £5 sterling. Tenders, which must be endorsed "Tenders for Mazagon-Sewri Reclamation," and accompanied by a deposit of Rs. 10,000 (£666), will be received by the Secretary, Bombay Port Trust, Bombay, up to 5.30 p.m., or by the Trustees' Consulting Engineers up to noon on April 2.

No date. St. Anne's-on-Sea.—*Erection of "New Carey Hall,"* Barrow Island, for the Barrow Island Baptist Mission, on a site in Ramsden Dock Road. Through tenders for the whole of the trades only will be accepted. Contractors desirous of tendering are requested to apply "at once" for bills of quantities and further particulars, to Rev. W. Walker, 34, Oxford Street, Barrow-in-Furness, or, W. Wade and F. Howorth, architects, Bank Chambers, The Square, St. Annes-on-Sea.

No date. Dyffryn.—*Erection of new offices* and carrying out drainage work at the Dyffryn Council School, for the Merioneth Education Committee. The plans, specification, and further particulars may be obtained on application to A. M. H. Jones, M.S.A., county architect, Plas Ynys, Borth, R.S.O.

No date. Nottingham.—*Erection of 3 houses*, Wells Road Nottingham. Persons desirous of tendering should send, stating trade, to F. Mitchell, architect and surveyor, 9, Upper Fountaine Street, Leeds, and quantities will be forwarded when ready.

No date. Corwen.—*Erection of boundary walls* around the new playground at the Corwen Council School, for the Merioneth Education Committee. The plans, specification, and further particulars amy be obtained on application to A. M. H. Jones, M.S.A., county architect, Plas Ynys, Borth, R.S.O.

ENGINEERING.

Dec. 17. Portsmouth.—*Construction and maintenance* of an overflow weir chamber on the existing main low-level sewer, an underground pumping station, and other works, for the Borough of Portsmouth. The specification, form of tender, and bill of quantities may be obtained from A. Hellard, town clerk, Town Hall, Portsmouth on payment of a sum of £2 2s. The drawings may be seen, and further information obtained, upon application at the offices of Bramwell & Harris, 5, Great George Street, Westminster, S.W. Tenders under seal, and endorsed "Tenders for Works for the Prevention of Storm Water Flooding in the Low-lying area of Southsea, Contract No. 3," must be delivered to the Town Clerk at or before 12 on Dec. 17

Dec. 17. Castleblayney.—*Construction of a storage reservoir*, filters and clear water tank, providing and laying cast-iron pipes, &c., for the U.D.C., according to plans and specifications prepared by F. Bergin, B.E., 36, Westmoreland Street, Dublin, which can be seen at the office of B. M'Ardle, clerk of Council, Courthouse, Castleblayney, during ordinary office hours. Tenders, accompanied by a schedule of prices, and containing the names and addresses of two solvent securities willing to join in a bond of £1,000, or a Guarantee Society bond for the same amount, for the due performance of the contract, will be received by the Clerk up to 12 noon on Dec. 17. Tenders should be addressed to the presiding Chairman and endorsed "Tender for Castleblayney Sewerage and Waterworks," and no tender will be considered which is not on the proper form, to be had from the Clerk for a payment of £1. As the Council have decided on joining the schemes in one contract, the aggregate amount in tender for sewerage and waterworks will be the deciding price.

Dec. 20. Belgium.—*Erection of metallic structures* on the quay-side at an estimated cost of 207,500 francs (£8,300). The specification (*Cahier des Charges*) relating to the contract may be obtained from the Hôtel de Ville, Antwerp, price 1 franc. Tenders should be sent in sealed registered envelopes, addressed "A Monsieur le Bourgmestre de la Ville d'Anvers," and should reach the Hôtel de Ville not later than Dec. 20. A deposit of 20,000 francs (£800) is required to qualify any tender. A copy of the specification may be seen at the offices of the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.

Dec. 21. Derby.—*Erection of new electric power station*, Silk Mill Lane. Plans may be seen, and form of tender, specification, and bill of quantities obtained, on application at the office of J. Ward, M.Inst.C.E., borough surveyor, Babington Lane, Derby, and upon the deposit of £1 1s. Tenders, endorsed "Power Station," are to be delivered in the special envelope provided for the purpose at the office of G. T. Lee, town clerk, Town Clerk's Office, 15, Tenant Street, Derby, not later than 10 a.m. on Dec. 21.

Dec. 22. Stockport.—*Electric light wiring and telephones* in connection with the new Town Hall, in accordance with specifications and schedules prepared by A. B. Thomas, architect, 5, Queen Anne's Gate, Westminster, S.W. Copies of the particulars for tender can be obtained of R. Hyde, town clerk, Town Clerk's Office, Stockport, or at the offices of the architect, on payment of a deposit of £1 1s. for each separate list. Tenders must be delivered to R. Hyde not later than noon on Dec. 22. Fair wages clause.

Dec. 31. Ashton-under-Lyne.—*Construction of an embankment*, &c., for the formation of a reservoir, and for other works on and about the Chew Brook, 3½ miles or thereabouts from the Friezland Station of the London & North-Western Railway, for the Joint Committee of the Ashton-under-Lyne, Stalybridge, and Dukinfield (District) Waterworks. Drawings can be seen and copies of the specification, schedule, and form of tender may be obtained at the offices of G. H. Hill & Sons, civil engineers, Albert Chambers, Albert Square, Manchester, and 3, Victoria Street, Westminster, upon receipt of cheque for £5 5s. Sealed tenders, endorsed "Tender for Chew Reservoir and Works," must be addressed to and forwarded to W. H. Rothwell, secretary to the Joint Committee, Town Hall Chambers, Ashton-under-Lyne, on or before Dec. 31.

Jan. 3. York.—*Construction of the Selby and Goole Railway*, about 10 miles in length, for the North-Eastern Railway. The works comprise double-line railways chiefly on embankment (upwards of 1,000,000 cubic yards), with stations, station yards, warehouses, cottages, and other buildings, sidings, and bridges. The steelwork of the latter will amount to about 1,100 tons. Plans may be seen, and specification, detailed quantities, and form of tender obtained, on personal application at the office of W. J. Cudworth, Company's engineer, York. Sealed tenders, marked "Tender for Selby and Goole Railway," to be addressed to R. F. Dunnell, secretary, and delivered at his office at York not later than noon on Jan. 3.

Jan. 16. Spain.—*Construction of an iron bridge* over the river Arevalillo, on the road from Villacastin to Vigo, at the estimated cost of 56,975 pesetas (about £2,071). Tenders will be opened on Jan. 16 at the Directorate General of Public Works, Madrid. Plans and specifications are on view at the above-mentioned office; conditions of tender are set forth in the "Gaceta." Local representation is necessary. The "Gacetas" may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

Jan. 19. Bridlington.—*Supply and erection of two sets* of deep-well pumping machinery, to be driven by steam, suction gas, or electricity, for the Corporation. Copies of specification, forms of tender, and permits to view the site, may be obtained of A. E. Matthewman, town clerk, Town Hall, Bridlington, on payment of £2. Tenders, endorsed "Tender for Pumping Machinery," are to be addressed to the Chairman of the Waterworks Committee and delivered at the Town Clerk's Office not later than Jan. 19.

No date. Aberdovey.—*Carrying out ventilation work* at the Aberdovey Council School, for the Merioneth Education Committee. The plans, specification, and further particulars may be obtained on application to A. M. H. Jones, M.S.A., county architect, Plas Ynys, Borth, R.S.O.

No date. Redhill.—*Fire escape staircases* at the Workhouse, Earlswood, Redhill, for the Guardians of the Poor of Reigate Union. Copies of plans and specification can be obtained on application to E. Penfold, A.R.I.B.A., architect, High Street, Reigate, Surrey.

Dec. 15. Handsworth.—*Supply, delivery and erection* of the following plant at their electric power station, for the U.D.C. Contract No. 15—Extension water-tube boilers (two); Contract No. 16—Extension engine (500 i.h.p.) and dynamos (one 315 kw. and two 45 kw.). Tenders will only be considered for the whole of the work covered by each specification, and not for any part thereof. Copies of the specifications, with the conditions of contract, &c., can be obtained from H. Ward, clerk, The Council House, Handsworth, near Birmingham, on payment of £3 3s. The specifications, conditions of contract and drawings, can be seen at (but not obtained from) the offices of the consulting engineers, Kennedy & Jenkin, 17, Victoria Street, Westminster, London, S.W. Tenders, on the prescribed form, in sealed envelopes, and endorsed on the outside "Electric Light and Power Supply Tender, Contract No. —," must be delivered to H. Ward, at the Council House, before noon on Dec. 15. Fair wages clause.

ROADS AND CARTAGE.

Dec. 13. Aberdeen.—*Macadamising (a) lane* from Menzies Road to Walker Road; (b) lane from Walker Road to Grampian Road; and (c) Sunny bank Place, for the Town Council. Plans may be seen and specification, schedule of quantities, and form of tender obtained, on application to W. Dyack, burgh surveyor, Burgh Surveyor's Office, Town House, Aberdeen, with whom sealed tenders, properly endorsed, must be lodged before 12 noon on Dec. 13.

Dec. 18. London, W.—*Making-up Stanway Gardens* and Emanuel Avenue, for Acton U.D.C. Plans and specifications can be seen, and bills of quantities obtained, at 57, High Street, Acton, during office hours. Tenders to be delivered at the Council Offices, 242, High Street, Acton, not later than 3 p.m. on Dec. 18.

Dec. 18. London, N.W.—*Execution of certain road-making* and paving works in the following roads:—Temple Road, Langton Road, and Oaklands Passage and Mews, Cricklewood; Denzil Road, Neasden; Chambers Lane, Willesden Green. Plans and specifications may be seen and all further particulars obtained upon application to O. Robson, M.Inst.C.E., engineer to the Council, Public Offices, Dyne Road, Kilburn, N.W. The tenders, upon printed forms, and endorsed "Private Streets," to be delivered at the offices of the Council not later than 4 p.m. on Dec. 18. A £10 note to be deposited with each tender.

Dec. 29. Horsham.—*Supply of*—(1) Picked surface flints and pit flints, delivered on the main roads; (2) broken quartzite, granite, or other stone to Shoreham Harbours and to railway stations; (3) tarred slag, or other tar macadam, to railway stations; (4) cartage from railway stations, wharves, and stone pits to main roads; and team labour per day, for the Roads and Bridges Committee, for the year ending March 31, 1908. Forms of tender may be obtained on application to W. McIntosh, county surveyor, County Surveyor's Office, 22, Worthing Road, Horsham, and applicants are requested to state which form of tender they require. Sealed tenders, endorsed "Tender for Materials" or "Tenders for Cartage," together with samples, to be delivered to the County Surveyor on or before Dec. 29.

Jan. 1. Reading.—*Supply of broken road materials*, setts, channels, and kerbs for the twelve months ending March 31, 1908, for the Berkshire C.C., delivered at railway stations and wharves in the county. On the receipt of a stamped addressed envelope, forms of tender, list of stations and wharves, and full particulars will be forwarded by J. F. Hawkins, county surveyor, Bank Chambers, Cross Street, Reading. Tenders, endorsed "Tender for Materials," to be sent to him by Jan. 1, 1907. The contractor will be required, if his tender be accepted, to enter into a contract to be prepared by the County Solicitor, such contract, if though desirable by the Solicitor, to provide for two sureties. A specimen form of contract may be seen at the office of the Clerk of the C.C., 28, The Forbury, Reading.

Jan. 12. Chelmsford.—*Laying about 140 sq. yds.* of footpaths with concrete flags, excavating, laying a concrete foundation, and paving with wood blocks an area of about 800 sq. yds. in New Street, Chelmsford. Plan and specification may be seen of C. Brown, A.M.I.C.E., borough surveyor, 16, London Road, Chelmsford. Tenders, endorsed "Tenders for Wod Paving," must be delivered at the office of T. Dixon, town clerk, Town Clerk's Office, 16, London Road, Chelmsford, not later than Jan. 12.

SANITARY.

Dec. 14. Bushbury.—*Supply and laying of about 1,190yds.* of 12-in., 2,030yds. of 9-in., and 650yds. of 6-in. stoneware pipe sewers, together with the construction of all manholes, lampholes, and flushing chambers required, also for the construction of sewage-disposal works, including detritus and septic tanks and three circular filters and appurtenances, for the Bushbury (Oxley District) sewerage and sewage disposal. Plans may be seen, and specifications, bills of quantities, and form of tender may be obtained, on application to the Engineer to the Council, H. M. Whitehead, Engineer's Office, Penkridge, Stafford, upon payment of £5 Bank of England note. Sealed tenders, on the forms supplied, endorsed "Bushbury Sewerage," must be delivered to A. W. Carver, clerk to the Council, Union Offices, Cannock, not later than 10 on Dec. 14.

Dec. 17. Bristol.—*Supply of lead pipe, glass*, and plumbers' sundries, during the three months ending March 31, for the Sanitary and Improvement Committee. Specification and form of tender may be obtained at the offices of T. H. Yabbicom, city engineer, 63, Queen Square, Bristol, on payment of 10s. Tenders must be sent, in the envelopes provided, to 63, Queen Square, not later than 1 p.m. on Dec. 17.

Dec. 17. London, N.W.—*Storm-water drainage works*, Edgware Road, comprising the following, or thereabouts:—95yds. linl. 24-in. pipes, 355yds. linl. 21-in. pipes, 1,115yds. linl. 18-in. pipes, 1,500yds. linl. 12-in. pipes, together with about 33 No. brick inspection chambers and 110 No. gullies complete. Also for certain kerbing, channelling, and stone paving works in the Edgware Road, West Hendon, all within the Urban District of Hendon. The drawings and specification may be seen, and form of tender obtained, of S. S. Grimley, engineer and surveyor, at the Council Offices, The Burroughs, Hendon, N.W., on deposit of £10. Sealed tenders, endorsed "Edgware Road Storm-Water Drain" and "Paving Works," addressed to the Chairman of the Council, to be sent to H. Humphris, clerk to the Council, Council Offices, The Burroughs, Hendon, N.W., not later than 5 p.m. on Dec. 17.

Dec. 19. Herne Bay.—*Construction of about 3¼ miles of brick and concrete* and pipe sewers, with all the necessary manholes, ventilators, and flushing arrangements, the construction of a pumping station, cottage, and buildings, and the provision of pumping machinery, for the U.D.C. Plans and specification of the works may be seen and the form of tender obtained at the office of B. Latham, M.Inst.C.E., Parliament Mansions, Victoria Street, Westminster, the engineer for the works, or at the office of F. W. J. Palmer, the surveyor to the Council, at his office at Herne Bay. The quantities of the several works have been taken out by C. E. Bruges, A.M.I.C.E., 1, Victoria Street, Westminster, and may be had on application either to the Engineer or Surveyor on deposit of £10. Sealed tenders, on the form supplied attached to the quantities, endorsed "Tender for Sewerage Works," are to be delivered to J. Jubb, clerk to the U.D.C., at Herne Bay, on or before noon on Dec. 19.

Dec. 19. Ware.—*Providing and laying* about 150yds. of 24-in. concrete tube storm-water drain and sundry other works in Star Street, Ware, for the U.D.C. The drawings and specification, with bill of quantities and form of contract, can be seen at the Office of the Council's Surveyor, H. F. Hill, New Road, Ware, between 10 a.m. and 4 p.m., and copies of the specification and forms of tender can be obtained on payment of £1 1s. Sealed tenders, endorsed "Star Street Drainage," are to be delivered to G. H. Gisby, clerk to the Council, Council Offices, Ware, not later than Dec. 19.

Dec. 20. London, S.E.—*Construction of an underground convenience* at Brockwell Park. Drawings can be seen and specification, bill of quantities, and form of tender obtained of H. Edwards, C.E., borough engineer, 346, Kennington Road, S.E., between 10 a.m. and 12 noon, and 2 p.m. and 4 p.m. (Saturdays excepted), on payment of £1 1s. Tenders, duly made on the prescribed form, must be delivered at the Town Hall, Kennington Green, S.E., not later than 12 noon on Dec. 20.

Dec. 21. Sedgefield.—*Execution of a scheme of main sewerage* and sewage disposal for Bishop Middleham, for the Sedgefield R.D.C. The proposed works in this contract comprise the furnishing and laying of about 2,200yds. of 12, 9, 8, 7, and 6-in. fireclay and cast-iron pipe sewers with Gaskin and cement joints, with manhole and lamphole shafts, storm overflow and screening chambers, bacterial tanks and filters, fencing, cartroad, &c. Contractors desirous of tendering are requested to send their names and addresses. not Tyne, accompanied by a cheque for £3. after which engineers, 3, St. Nicholas Buildings, Newcastle-on-Tyne, accompanied by a cheque for £3, after which ful partilculars and quantities will be forwarded. The engineers will arrange in due course to locally meet the intending contractors and go over the route of the said works and explain plans and specification. Sealed tenders, endorsed "Tender for Bishop Middleham Sewerage," must be sent to J. W. Lodge, clerk, Union Offices, Sedgefield, Ferryhill, not later than 10 a.m. on Dec. 21.

Dec. 21. Valetta.—*Supply of stoneware pipes and specials.* Sealed tenders will be received at the office of the Receiver-General and Director of Contracts, Valetta, up to 11 a.m. on Dec. 21. Tenders are to be accompanied with a deposit of £50, to be made in the office of the Crown Agents by tenderers residing in Great Britain not having a representativeg in Malta, and in the office of the Receiver-General by local tenderers. Contract fees to be paid by the contractor. Particulars, specification, &c., may be obtained on application to W. Casolani, Receiver-General and Director of Contracts, or to the Crown Agents for the Colonies, Whitehall Gandens, London.

Jan. 2. Epping.—*Construction of sewage disposal works* and the laying of about 2,500 yds. lineal of pipe sewers, with manholes and contingent works in the parish of Chigwell, for the Epping R.D.C. Drawings can be seen, and further particulars and bills of quantities obtained, at the office of H. Tooley, A.R.I.B.A., Buckhurst Hill, upon the deposit of £10. Applications for bills of quantities must be made before Dec. 19. Tenders to be on the forms supplied, and sent in the envelopes provided, to R. D. Trotter, clerk, Epping, Essex, on or before 6 p.m. on Jan. 2.

Jan. 7. Stourport.—*Provision, laying and jointing* of cast-iron and stoneware pipe sewers, together with manholes, lampholes and flushing chambers, the construction of task sewer, engine-house, liquefying tanks, distributing carriers, effluent drains, and other incidental works, in accordance with the drawings and specification prepared by the engineers. Drawings and specification may be seen and bills of quantities obtained at the offices of Wilcox & Raikes, engineers, 63, Temple Row, Birmingham, on payment of a deposit of £5 5s. Sealed tenders, in the envelopes supplied, endorsed "Stourport Sewerage—Contract No. 1," to be delivered to C. H. Watson, clerk to the Council, Stourport, not later than 12 o'clock noon on Jan. 7.

Jan. 30. Weaste.—*New sewage pumps* to two large pumping engines at the Salford Sewage Works, Weaste. Drawings and specifiations may be obtained from the Borough Engineer, Town Hall, Salford, on payment of £1. Tenders, endorsed "Sewage Pumps," and addressed to "The Chairman of the Rivers Committee, Town Hall, Salford," must be delivered to L. C. Evans, town clerk, Town Hall, Salford, not later than 12 noon on Jan. 30.

MISCELLANEOUS.

Dec. 15. Longton.—*Supply for twelve months ending Dec. 31, 1907, of the following:*—Broken granite and granite setts, Macclesfield setts, stone kerbs, cast-iron work, ironmongery, lime, Portland cement, blue paving bricks, earthenware pipes, wheelwright's work. Specifications and forms of tender may be had on application to J. W. Wardle, Assoc.M.Inst.C.E., borough surveyor, Court House, Longton, Staffordshire. Tenders under seal, endorsed "Tender for Granite, &c.," as the case may be, are to be left with him on or before Dec. 15.

TOO LATE FOR CLASSIFICATION.

A copy of the plans and specification will be deposited at the Council School, Hedon, after the above date for the convenience of persons tendering. Tenders endorsed "Hedon Council School Extension" must reach J. Bickersteth, clerk to the East Riding Education Committee, County Hall, Beverley, on or before 10 a.m. on Dec. 17.

Dec. 17. Leeds.—*Cleaning down, painting, &c.*, at the Union Street, Holbeck Lane, and Kirkstall Road Baths. Forms of tender, specifications, and all particulars may be obtained, and copies of the documents forming the contracts may be inspected, at the City Engineer's Office on payment of a deposit of £1 1s. Tenders, properly endorsed, should be received at the Town Clerk's Office, not later than 10 a.m. on Dec. 17.

Dec. 17. Flemington.—*Construction of a goods yard* and relative works at Flemington, Motherwell, for the Directors of the Caledonian Railway Co. Drawings may be seen at the office of the Company's Engineer, Buchanan Street Station, Glasgow, where copies of the specification and schedule may be obtained on payment of £2 2s. An asistant engineer will attend at Flemington Station on Thursday, Dec. 6, at 11 a.m., to accompany contractors over and point out the line of the works. Sealed tenders, endorsed "Tender for Flemington Goods Yard," to be lodged with J. Blackburn, secretary, Caledonian Railway Company's Offices, 302, Buchanan Street, Glasgow, on or before Dec. 17.

Dec. 18. Durham.—*Additions to Croxdale Council School.* Plans, specifications, and conditions of contract may be seen of W. Rushworth, F.R.I.B.A., architect, County Education Offices, Shire Hall, Durham. Quantities may be obtained on application to the Architect, to whom sealed endorsed tenders must be delivered not later than Dec. 18.

Dec. 18. Crewe.—*Erection of new offices* and stores at the Electric Light Works. Persons desirous of tendering may obtain copy of quantities and conditions of contract on application to G. Eaton-Shore, borough surveyor, Municipal Offices, Earle Street, Crewe. The drawings may also be seen at his office. A deposit of £1 must accompany each application. Tenders to be sent to F. Cooke, town clerk, Municipal Offices, Crewe, not later than Dec. 18, at 10 a.m., endorsed "Tender for Offices and Stores."

Dec. 18. Cymmer.—*Private street improvement works* in Margam Street, Cymmer, for the Glyncorrwg U.D.C. Plans and specifications may be seen and bills of quantities obtained of W. P. Jones, surveyor, Council Offices, Cymmer, Port Talbot. Sealed tenders, marked "Tender for Street Works," and giving names of two sureties who will join in a bond for the due performance of the work, to be sent to Cuthbertson & Powell, clerks, Water Street, Neath, not later than Dec. 18.

Dec. 20. Killiney.—*An addition to the Victoria Hill Lodge*, Killiney, for the Killiney and Ballybrack U.D.C. Plan and specification may be seen of R. Cunningham, clerk of council, Council Offices, Killiney, during office hours. Marked tenders to be delivered to him before Dec. 20.

Dec. 29. Seacombe Ferry.—*Erection of new ferry workshops* at Seacombe Ferry, for the Wallasey U.D.C. Drawings and specifications may be seen, and form of tender and bill of quantities obtained, on application to W. H. Travers, engineer and surveyor, Public Offices, Egremont, Cheshire, on payment of a deposit of £1. Tenders in sealed envelopes, endorsed "New Workshops, Seacombe Ferry," to be addressed to H. W. Cook, clerk and solicitor, and forwarded through post for delivery at the Public Offices not later than Dec. 29.

Dec. 29. Carmarthen.—*Erection of new workhouse* at Carmarthen. Contractors desirous of tendering are requested to send in, not later than Dec. 8 next, their names and addresses to A. I. Jones, Board's architect, 2, Spilman Street, Carmarthen, together with a cheque for £2 2s. for bill of quantities. Sealed tenders (marked "New Workhouse") must be delivered to J. Saer, clerk to the Guardians, 7, Hall Street, Carmarthen, not later than Dec. 28. The tenders will be opened at the Board meeting on Dec. 29.

Jan. 1. Bray, Ireland.—*Supplying and erection of a high-tension* switchboard and instruments. Specification and form of tender may be obtained from W. J. U. Sowter, A.M.I.E.E., electrical engineer to the Council, on payment of a deposit of £2 2s. Tenders, sealed and endorsed "Switchgear," to be delivered to P. MacDonnell, clerk to the Council, Town Hall, Bray, Ireland, not later than 10 a.m. on Jan 1.

Jan. 1. Norwich.—*Supply of 160,000 red bricks*, equal in all respects to the sample which may be seen of A. E. Collins, M.Inst.C.E., city engineer, Guildhall, Norwich; delivered as, when, and in such quantities as are required, alongside the sewage works in progress between Old Lakenham and Hall Road, Norwich. Tenders, on the forms supplied, enclosed in envelopes sealed with sealing wax, endorsed "Bricks," and addressed to the Chairman of the Sewerage Committee, must be delivered to the City Engineer not later than 10 a.m. on Jan. 1.

Jan. 7. Scarborough.—*Construction of a group* of carriage sidings (about 4 miles in length) at Scarborough, on the west side of the Scarborough and Whitby Railway, for the Directors of the North-Eastern Railway. Plans may be seen, and specification, detailed quantities, and form of tender obtained, on personal application only, at the office of W. J. Cudworth, the Company's engineer, York. Sealed tenders, marked "Tender for Carriage Sidings, Scarborough," to be sent to the Secretary, at York, not later than noon on Jan. 7.

Jan. 17. London, S.E.—*Alterations and additions at the Infirmary*, Lower Road, Rotherhithe, S.E., according to plans and specification prepared by A. H. Newman, and quantities by W. T. Farthing & Son. Persons desirous of tendering for the works are required to send their names and addresses before Dec. 8 to E. P. Fenton, clerk to the Guardians, 283, Tooley Street, S.E., and to deposit with him a £50 Bank of England note. As soon after Dec. 8 as possible, forms of tender, bills of quantities, etc., and all other necessary information will be supplied to those persons whose names, addresses, and deposits have been supplied to the Clerk to the Guardians. The specification and plans of the works will then be open for inspection by such persons at the architect's offices, A. H. Newman, 31, Tooley Street, London Bridge, S.E., on production of the form of tender. Fair wages clause. Sealed tenders, endorsed "Tender for Alterations and Additions, Infirmary," must be delivered personally to E. P. **Fenton, clerk, 283,** Tooley Street, S.E., at 6 p.m. on Jan. 17, accompanied by the bills of quantities, &c., in a separate sealed envelope. The tenders will be opened and considered at 7 p.m. at the meeting of the Guardians on Jan. 17, at their Board Room, at which place, date, and time a responsible member of the firm tendering must be in attendance.

No date. Bagillt.—*Erection of an English Calvinistic Methodist Church* at Bagillt. Plans and specifications to be had from R. Jones, jun., architect, Holywell. Tenders to be sent to Rev. R. G. Jones, Rosscairn, Egremont, Cheshire.

No date. Swansea.—*Construction and erection of two swing bridges*, one over the entrance lock to the King's Dock, and the other over the communication passage with the Prince of Wales' Dock, together with hydraulic machinery for working the same, for the Swansea Harbour Trust. Specifications and plans and forms of, and instructions for, tender can be obtained on application to T. Strick, clerk, Harbour Offices, Swansea, on payment of £5 5s.

New London Buildings

At yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:

Erection of a low brick wall, 3ft. high, in connection with Durning Mission Hall, Elsa Street, Limehouse, placed at an angle of 45 degrees across the angle formed in the passageway at the southern end of the widening and erected with the top of the wall raked back into the angle so that nothing can be deposited there. (*Consent.*)

Buildings abutting upon new street to lead from Southampton Row, Holborn, to Vernon Place, without requiring the portion of such new street as is to be on the site of Nos. 42 and 43a, Bloomsbury Square, to be formed and laid out, on the application of R. J. Worley, on behalf of the Selected London Properties Co. (*Consent.*)

Projecting shelter in front of the Blackfriars Station of the Metropolitan District Railway, Queen Victoria Street, City, in connection with the application of C. H. King, on behalf of the Metropolitan District Railway Co. (*Consent.*)

Retention of wood and glass screens at the sides of a projecting porch in front of No. 17, Queen's Gate, Kensington, on the application of J. W. Restler. (*Consent.*)

Three houses with one-storey shops in front, on the site of No. 63, Dartmouth Road, Forest Hill, and the erection of additional storeys over the existing shops at Nos. 55 and 55a, Dartmouth Road, on the application of E. C. Christmas. (*Consent.*)

Porch and two balconies in front of De Walden Court on the northern side of New Cavendish Street, St. Marylebone, on the application of D. Joseph, on behalf of F. Britton. (*Consent.*)

Iron and glass addition at the first floor level in front of the Alhambra Music Hall, Leicester Square, in connection with the application of W. M. Brutton, on behalf of the Alhambra Co. (*Consent.*)

Retention of a projecting sign in front of No. 121, Victoria Street, Westminster. (*Consent.*)

Porches in front of nine houses on the southern side of Putney Heath Lane, Wandsworth, eastward of Dungarvon Cottage, on the application of H. Bignold, on behalf of W. Tucker. (*Refusal.*)

Buildings at the rear of No. 58a, Earl's Court Road, Kensington, on the application of A. E. Parsons, on behalf of A. Roberts & Co., Ltd. (*Consent.*)

Iron and glass verandah in front of a motor garage at "The Logs," Well Road, Hampstead, on the application of W. A. Hudson, on behalf of F. C. Pusinelli. (*Consent.*)

Forecourt fence in front of No. 144a, Trafalgar Street, Walworth, also a projecting one-storey porch in front of the said building, on the application of R. J. Dickins, on behalf of the Right Hon. the Lord Llangattock. (*Consent.*)

Wood and iron building, of a temporary character, at the side of No. 39, Munster Road, Fulham, on the application of J. Cable, on behalf of J. H. Neave. (*Consent.*)

Retention of a photographic showcase in front of No. 194, New Kent Road, Newington, on the application of M. B. Olley. (*Consent.*)

Buildings on the northern side of Longford Street, to abut also upon the western side of Little Albany Street, with an irregular open space at the rear, on the application of P. B. Tubbs, on behalf of H. B. James. (*Consent.*)

Building No. 152, Lower Kennington Lane, with an irregular open space at the rear, also external iron staircases and balconies on the open space at the rear of Nos. 142 to 152 (even numbers only) inclusive, Lower Kennington Lane, on the application of C. Barker, on behalf of the Duchy of Cornwall. (*Consent.*)

Building on low-lying land situated at Baffin's Place, Bermondsey. (*Consent.*)

Six cottages on low-lying land situated at Nos. 74 to 79, George Row, Bermondsey, on behalf of Mrs. Portlock. (*Consent.*)

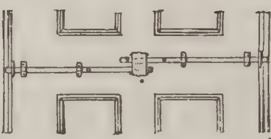
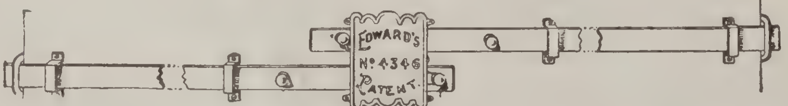
PATENT BOLT-LOCK
A Powerful Bolt for the Front Door that can be Locked from the Outside.

Burglars cannot force the door or obtain an entry by Picking the Lock or False Keys when this Lock is fitted.

It bolts on the inside, where either Bolt can be opened or locked by hand; from the outside by means of the key provided, which needs turning twice either to lock or unlock. The Bolt shoots into hasps inset in each door-post and cannot be forced. When only one Bolt is shot, and this is desirable when everybody has retired for the night, the Lock cannot in any way be opened from the outside.





Specially recommended for the **Front Doors of Flats, Houses, Offices, Store Rooms, etc., etc.** It is designed mainly to enable the **Bolting and Unbolting of a Door from the outside,** so necessary **where Houses, Flats, etc., are occasionally left unattended.** The Lock is made in four qualities, nicely finished, for any width of Door. Stocked for 36-in. Doors or narrower.

For full Particulars or to see Sample, write to

CHITTENDEN & CO., 110, Fenchurch Street, London, E.C.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—adjudication.]

DURING THE WEEK ending December 7th twenty-three failures in the building and timber trades in England and Wales were gazetted.

H. J. WILLIAMS, painter, Great Yarmouth. R.O., Dec. 1.

I. WATSON, joiner and builder, Colne. R.O., Nov. 30.

A. KEW, builder, near Basingstoke. R.O., Nov. 30.

W. COATES, plumber and painter, Longridge. R.O., Nov. 27.

J. ROBERTS, joiner and builder, Llanynys. R.O., Nov. 29.

J. LAWSON, builder, Teddington. P.E., Kingston C.C., Jan. 8, at 2.30.

MARRIOTT & SALTER, builders and contractors, Caterham Valley. Adj., Nov. 28.

WILLS, SOLA & CO., contractors, builders and decorators, Ealing. R.O., Nov. 27.

G. SWAN & SONS, builders and contractors, Kensington and Hammersmith. Adj., Nov. 30.

A. A. ADAMS, timber merchant, London, E.C. R.O., Nov. 26. P.E., Bankruptcy Court, Jan. 16, at 11.

D. EDWARDS, builder and contractor, Ynysddu. First meeting O.R.'s, Newport, Dec. 12, at 12. P.E., Town Hall, Newport, Jan. 8, at 11.

JOHN HADLEY, brick manufacturer, Tividale. Gross liabilities, £9,605; estimated assets, £3,425; net deficiency, £566.

R. WILLIAMS, painter and decorator. P.E., County Police Buildings, Blaenau, Festiniog, Dec. 11, at 1.

J. POWELL, builder and contractor, Pembroke. First meeting, Temperance Hall, Pembroke Dock, Dec. 7, at 1.15. P.E., same, at 12. R.O., Nov. 19.

F. C. IRONMONGER, timber merchant, Birmingham. First meeting, 191, Corporation Street, Birmingham, Dec. 12, at 11. P.E., Birmingham C.C., Jan. 16, at 2.30.

A. H. CLARKE, painter and decorator, Bristol. First meeting, O.R.'s, Bristol, Dec. 5, at 12.15. P.E., Guildhall, Bristol, Dec. 21, at 12. R.O., Nov. 23.

B. COLDWELL, painter and decorator, Huddersfield. First meeting, O.R.'s, Huddersfield, Dec. 6, at 3. P.E., Huddersfield C.C., Jan 21, at 2. R.O., Nov. 19.

G. SWANN & SONS, builders and contractors, Kensington and Hammersmith. First meeting. London Bankruptcy Court, Dec. 6, at 11. P.E., same, Jan. 15, at 11.30. RO., Nov. 19.

Coming Events.

Wednesday, December 12.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. James L. Lawrence on "The Sanitary Considerations of Building," at 8 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Students' Visit to the Wire-rope Works of Messrs. Bullivant & Co., Ltd., Millwall, E., at 2.30 p.m.

Thursday, December 13.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.—Mr. J. B. Mitchell-Withers, A.R.I.B.A., on "Brickwork."

MANCHESTER SOCIETY OF ARCHITECTS.—Mr. T. Mawson on "The Unity of House and Garden," at 6.30 p.m.

Friday, December 14.

ARCHITECTURAL ASSOCIATION.—Mr. W. Howard Seth-Smith, F.R.I.B.A., on "The Architecture of Sicily," at 7.30 p.m.

ARCHITECTURAL ASSOCIATION (Camera and Cycling Club).—Mr. C. Wontner Smith on "Thaxted and Neighbourhood," at 7.30 p.m.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—Mr. Arnold Mitchell, F.R.I.B.A., on "The Study of Medieval Architecture."

GLASGOW TECHNICAL COLLEGE ARCHITECTURAL CRAFTSMEN'S SOCIETY.—Mr. Colin Sinclair on "The Philosophy of Art."

INSTITUTION OF CIVIL ENGINEERS.—(Students' Meeting.) Mr. A. Carmichael on "Mechanical Improvements in the Drainage of the Bedford Level," at 8 p.m.

INSTITUTION OF MECHANICAL ENGINEERS.—Mr. Henry Fowler, M.I.C.E., on "The Lighting of Railway Premises: Indoor and Outdoor," at 8 p.m.

Monday, December 17.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Mr. W. J. Dibdin on "The Strength and Composition of Mortars," at 8 p.m.

Tuesday, December 18.

ARCHITECTURAL ASSOCIATION (Discussion Section).—Mr. L. Stanley Crosbie on "The Responsibilities of Style," at 7.30 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. A. Hay Lamont, A.R.I.B.A., on "The Seventh International Congress of Architects," at 8 p.m.

Wednesday, December 19.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Mr. James L. Lawrence, M.R.San.I., on "The Sanitary Considerations of Building," at 8 p.m.

Thursday, December 20.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—Mr. Mouchel on "Reinforced Concrete," at 6 p.m.

Educational.

ARCHITECTURAL ENGINEERING and Structural Steel Work, Personal Instruction for Architects and Engineers, by a Civil Engineer engaged in this work. Candidates prepared for A.M.I.C.E. Exam.—Reply Box 560, T. B. BROWNE'S ADVERTISING OFFICES, Glasgow.

ARCHITECTURAL EXAMS.—Preparation by correspondence for R.I.B.A., S.A., and Bd. of Ed. (Architecture and Building Construction) Exams.—Write for free booklet to H. HODGSON, A.R.I.B-A., 7, Claremont, Bradford.

R.I.B.A. EXAMINATIONS.—Personal or Correspondence Tuition. Only four failures during last seven years; ninety-five per cent. passes. All necessary books lent.—GEO. FISHER, The Grange, Melbourne, Derbyshire.

R.I.B.A., SOCIETY OF ARCHITECTS, AND CIVIL SERVICE TECHNICAL EXAMINATIONS, preparation by correspondence or residence. 29 first places.—G. A. T. MIDDLETON, 19, Craven Street, Strand.

QUANTITIES.—A course of Correspondence Lectures in this subject (on the London system) is now ready. Also Lectures in Estimating.—For particulars apply Box 632, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

R.I.B.A. EXAMS.—Personal and Correspondence tuition; courses of any duration. Apply for Syllabus to Mr. A. G. BOND, B.A., Oxon, A.R.I.B.A., 115, Gower Street, London, W.C. (late Howgate and Bond).

SURVEYORS' INSTITUTION, A.M.I.C.E. &c., EXAMINATIONS.—Mr. G. P. KNOWLES, A.M.I.C.E., F.S.I. ("Galsworthy" and twice "President's" Prizeman), M.R.San.I., personally PREPARES CANDIDATES in CLASS or by CORRESPONDENCE for the EXAMINATIONS of the Surveyors' Institution, the Institution of Civil Engineers, the Municipal and County Engineers, Civil Service (technical), &c. Courses for the next examinations are just commencing.—Apply 39, Victoria Street, Westminster, S.W. Tel. No. 1,402 Victoria.

SURVEYORS' INSTITUTION EXAMINATIONS. — Complete COURSES of PREPARATION for these EXAMINATIONS are given either in Class or by Correspondence or in Office, by Messrs. PARRY, BLAKE & PARRY. At the Examinations of last March the following Prizes were obtained by their pupils:—Penfold Gold Medal, Penfold Silver Medal, Institution Prize, Special Prize, Crawter Prize, Beadel Prize (Six Prizes out of the eight awarded).—For full particulars of these Courses, or for any advice with respect to the Examinations, apply to Messrs. PARRY, BLAKE, & PARRY, 82, Victoria Street, Westminster. Telephone: 680 Westminster.

THE ARCHITECTURAL ASSOCIATION.

DECEMBER 14th—ORDINARY GENERAL MEETING at No. 18, Tufton Street, Westminster, S.W., at 7.30 p.m. Paper by Mr. W. HOWARD SETH-SMITH on "The Architecture of Sicily" (illustrated with lantern views).

HENRY TANNER, JUN., } Hon. Secs.
C. WONTNER SMITH, }

STRUCTURAL STEELWORK

Can you Design your own Steelwork? Do you know how to properly proportion your columns, stanchions, and girders? We guarantee to teach you how to do this in a few lessons by our System of Correspondence Tuition in Architectural Steelwork.—Apply to us for free Booklet J (4th edition), MIDLAND ENGINEERING BUREAU, Strand, Derby.

PRACTICAL DESIGNING of STEEL CONSTRUCTIONAL WORK taught by Correspondence, individually or in classes. Elementary and advanced courses arranged for Architects, Engineers, &c. Write for Prospectus B., EMBANKMENT ENGINEERING INSTITUTE, 156, Temple Chambers, Temple Avenue, E.C.

To Contributors.

THE EDITOR will be pleased to consider any articles, illustrated or otherwise, dealing with old and new buildings, methods of construction, or other matter of an architectural character. He will also be glad to consider architectural photographs and sketches (the latter preferably in black and white) and measured drawings of work in this country or abroad. News items of interest to architects and builders will also be considered, provided the name and address of the sender are given; no notice will be taken of anonymous contributions. All communications should be addressed to the Editor of THE BUILDERS' JOURNAL, 6, Great New Street, E.C.

If you are at the present time **Seeking a Situation** or if you wish to better your present position,

The "Builders' Journal" Employment Register

offers you exceptional facilities for making your requirements widely known.

Those who have used our columns when advertising for fresh berths have expressed the greatest satisfaction at the results they have obtained, and we append a letter received from one of them:—

> "Kindly remove my name from your Employment Register. I am glad to say I have obtained a berth through its agency, for which I am obliged to you."

Every week—we might say every day—we get fresh evidence that employers consult the "Builders' Journal" Employment Register, and appended are a selection from the letters received lately.

A large firm of Builders' Merchants write:

> "Referring to the 'Builders' Journal' Employment Register, will you ask No. 1585 to send us particulars of experience, salary required, &c."

A well-known F.R.I.B.A. writes:

> "Kindly put me into communication with your advertiser, No. 1637, as soon as possible."

A large firm of provincial Architects write:

> "Can you put the following advertisers into communication with us: 1649, 1652, 1654, 1660, 1681 and 1712, and oblige."

The above letters speak for themselves, and it only remains for you to give the Employment Register a trial, and below we give full particulars of the cost of making your requirements known.

For 3s. we give three insertions (four lines) in our "Appts. Wanted" Columns, and also 6 insertions in the "EMPLOYMENT REGISTER" (see page xxiv).

VOLUMES to XXI. of
THE BUILDERS' JOURNAL
Handsomely bound in cloth gilt 7/- each.
Binding Cases for any of the above Volumes can now be obtained, price **1/9** each.

NOTICE TO OUR SUBSCRIBERS.

THE INDEX OF "THE BUILDERS' JOURNAL."

The Title Pages and Index to any volume of "THE BUILDERS' JOURNAL" may be had free, upon application being made to the Office, Great New Street, enclosing 1d. stamp to cover postage of same

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

ARCHITECT'S ASSISTANT (Scotch); 14 years' good general experience; design working drawings, details, &c.; good references. Moderate salary. London preferred.—Box No. 2216, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S ASSISTANT (23) seeks ENGAGEMENT; working drawings, details, quantities, surveying, &c.; good draughtsman and excellent refs.—J. W. H., "Homeleigh," Ashgate Road, Chesterfield. 2215

ARCHITECT'S ASSISTANT (23) seeks RE-ENGAGEMENT; over 6 years' all-round experience; planning, quantities, surveys; neat draughtsman; excellent refs. Mod. sal. Student R.I.B.A.—Box 2211, BUILDERS' JOURNAL OFFICE, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT (29), wishing to purchase a practice, seeks a POSITION as ASSISTANT with view to superseding principal.—Box 2220, BUILDERS' 6, Great New Street, London, E.C.

ARCHITECT'S JUNIOR or IMPROVER (23), 5½ years' experience; plans; working drawings; details, colouring, &c.—WILLIAM BUCHANAN, Clifton, Motherwell, N.B. 2241

ARCHITECT'S ASSISTANT desires SITUATION: served articles; good draughtsman; drawing from life; 5½ years' general exp.; good tests. and certs. Moderate salary.—Box 2222, BUILDERS' JOURNAL Office, 6, Great New Street, London, E.C.

ARCHITECT & SURVEYOR'S ASSISTANT (24), DISENGAGED; 7 years' all-round experience; abstainer; design prize-winner; moderate salary.—Box 2229, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, London, E.C.

ARCHITECT'S JUNIOR ASSISTANT (21); 4½ years' varied experience; assist with quantities; good references.—G. EWINGTON, 72, St. Ann's Hill, Wandsworth, S.W. 2228

ARCHITECT'S ASSISTANT (25) DISENGAGED. Nine years' experience; good draughtsman, designs, working drawings, details, etc.; London or country.—W. A. N., 46, St. Augustine's Road, Camden Square, N.W. 2233

ARCHITECT'S ASSISTANT (25) desires ENGAGEMENT. Working drawings, details, perspectives, quantities, &c. Good designer and colourist.—AUBREY PRITCHARD, The Grove, Rhyl, North Wales. 2232

ARCHITECT'S JUNIOR ASSISTANT desires RE-ENGAGEMENT in a good London office: 6 years' experience; good references; salary moderate.—B. E. ATKINSON, Junr., 14, Rosslyn Hill, Hampstead, N.W. 2245

ARCHITECT'S JUNIOR ASSISTANT requires ENGAGEMENT. Neat draughtsman, tracer, colourist, &c. Specimens submitted. When writing state salary offered.—Apply J.E.T., 24, Ashbourne Road, Mitcham, Surrey. 2227

ARCHITECT'S ASSISTANT; 12 yrs.' experience, 3 in building; general drawings, perspectives, surveys, levelling, quantities, accounts, supervision; ex. refs.; mod. salary; temporary or permanent.—Box 2261, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S ASSISTANT (21), served 5 yrs. in country, wants SITUATION in London office; salary optional.—C. G. COWLISHAW, Friars Wood House, Newcastle, Staffs. 2256

ARCHITECTURAL ASSISTANT; age 25; details: working drawings, drainage, specifications, perspective, etc.; salary, £2 10s.—F. W. L., 22, St. James' Square, Notting Hill, W. 2258

ARCHITECT and SURVEYOR'S ASSISTANT, with 11 years' provincial and London experience, shortly disengaged, DESIRES BERTH; salary moderate.—SURVEYOR, 6, Walcot Parade, Bath. 2267

ARCHITECT'S and SURVEYOR'S ASSISTANT (20); working drawings from rough sketches, details, land surveying, quantities, typewriting; 3 building construction certificates; salary, 22s.—H.L.M., 5, Winton Street, Hyde. 2266

ASSISTANT (27), 12 years' first-class experience; passed final R.I.B.A.; design working, drawings, details, perspectives, specifications, supervision, quantities and general office work; salary very mod.—B., 85, Durham Road, East Finchley. 2223

BUILDER desires a SITUATION in any capacity; would take entire charge of an estate, large or small, in any district and execute repairs; building or alterations; finding all tools and plant; highest references.—LEWIS, 9, King's Parade, Isleworth. 2214

BUILDERS' MANAGER or FOREMAN, capable of interviewing clients, measuring, estimating, setting out, and general supervision of outside jobs: last situation 9 years (London). Carpenter by trade.—Box 2192, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

BUILDER'S ASSISTANT, age 33, seeks SITUATION; nineteen years' experience; well up in the various branches: first class references. —Address, Box 2208, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

BUILDER'S ASSISTANT or GENERAL FOREMAN, builder's son, 12 years' experience, desires a SITUATION; well up in levelling, plans, measuring-up and setting out work (new and alterations), taking out quantities, timekeeping, and general builders' work.—Address B. R. MOORE, Sunny Bank, Cold Harbour, Sherborne, Dorset. 2254

CLERK of WORKS or GENERAL FOREMAN (Carpenter and Joiner), large and varied experience, practical in all branches, well up in plans, &c. Recently completed large industrial development as clerk of works; age 38.—Box 2246, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

CLERK OF WORKS desires ENGAGEMENT; past experiences: library, theatre, almshouses, factories, furnaces, steam boilers, heating, electric lighting, hydrants and sprinklers,—G. R., 17, Sweet Briar Walk, Upper Edmonton, N. 2213

CLERK of WORKS wants RE-ENGAGEMENT. Town or Country. Experienced and practical. First-class references from London and country architects.—F. B. S., 17, Southborough Road, South Hackney, London, N.E. 2242

CLERK OF WORKS wants RE-ENGAGEMENT; Town or Country; experienced and practical; excellent references and testimonials from Architects and Public Bodies.—T.H., 51, Bury Street, Lower Edmonton, N. 2191

CARPENTER, JOINER wants JOB. Bench, fixing or jobbing, or will take piecework any quantity; labour only; good testimonials.—H., 86, Alderney Street, Pimlico, S.W. 2225

CLERK OF WORKS or GENERAL FOREMAN seeks RE-ENGAGEMENT, town, country or abroad; thoroughly experienced home and abroad; good testimonials; age 35.—P. G., 428, Uxbridge Road, W. 2224

ESTIMATOR'S ASSISTANT (22), DISENGAGED; quick and reliable at figures; abstracting and accounts; used to large works, also time, wages, and general routine; good references.—A., 100, Hamilton Road, Wimbledon. 2230

GENERAL WORKING FOREMAN seeks RE-ENGAGEMENT. Trade Carpenter and Joiner; age 33; abstainer; reliable; 6 years' good references.—A. C. SMITH, 86, Brunswick Road, Leyton. 2244

GENERAL OR WORKING FOREMAN (carpenter), new or alterations. o. management, good jobbing. Practical experience all branches, good manager of men; well-up in plans.—W., 29, Pollock Road, Walworth, S.E. 2205

GENERAL or WORKING FOREMAN DISENGAGED. In London or country. Twenty years' practical experience in new building and alterations. Trade, bricklayer. Age 43. Good references from last employers.—H.C., 5, Westbury Road, Paddington. 2226

GENERAL FOREMAN DISENGAGED; trade, bricklayer; age 30, and life abstainer; 5 years with present firm; large experience in Church work; a good detail draughtsman and manager of men; excellent references.—Address B. T. A., care of Byhurst, 2, The Parade, Chiswick Lane, London, W. 2253

GENERAL or WORKING FOREMAN (carpenter); new or alterations, town or country; practical experience all branches; good manager and timekeeper; moderate wage.—W., 29, Pollock Road, Walworth, S E. 2263

IMPROVER to the Writing, Graining, Decorating, &c., wants SITUATION; age 21; just finished apprenticeship.—F. CLARKE, 112, Cox Street, Coventry. 2186

MANAGER or GENERAL FOREMAN seeks ENGAGEMENT; thoroughly practical; drawings, quantities, estimates and supervision; excellent references; terms moderate.—J. F. S., 67, Leyton Park Road, Leyton. 2255

PAINTER (good) requires WORK; young man, age 27; town or country; used to all classes of work; abstainer; state wages.—A.W.P., 19, Chesterfield Gardens, Harringay, Middlesex. 2175

PLUMBING, GAS, HOT WATER.—Wanted piecework, by certificated plumber; first-class builder's reference.—Apply, PLUMBER, 93, Fulham Palace Road, Hammersmith. 2270

QUANTITY SURVEYOR'S ASSISTANT (22) desires ENGAGEMENT; 6 years' London experience working up and taking off; temporary or otherwise; London or Provinces; salary moderate.—Box 2165, BUILDERS' JOURNAL.

QUANTITY SURVEYOR'S ASSISTANT (21) desires ENGAGEMENT, temporary or permanent, working up and taking off. Excellent references.—Box W., BUILDER'S JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

TO BUILDERS.—Carcasing, Fixing Stairs, or Joinery WANTED, Piecework, Houses taken right out. Labour only.—G. BOWN, 27, Spruce Hill Road, Walthamstow. 2239

TO QUANTITY SURVEYORS.—Assistant (30); quick, reliable, good London experience, taking off, measuring-up, expert worker-up, &c. Temporary or permanent; terms moderate.—Box 2169, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

WORKING GENERAL FOREMAN seeks SITUATION; trade bricklayer; age 30; good references, abstainer.—Address M. G. C., 25, Jerrard Street, Lewisham, S.E. 2247

Appointments Vacant.

ARTICLED PUPIL.—VACANCY for same in old-established London (W.) Architect and Surveyor's office.—Box 2251, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

CLERK WANTED for Builders' office in North Northumberland; give references and state qualifications and salary required.—Apply, Box 2257, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

TRAVELLER calling on builders; commission paid on receipt of orders; great demand; sells at sight; used by all railway companies.—SANATORIUM AIR BRICK, 58, Denmark Road, Southport. 2259

TRAVELLERS, with connection amongst Architects, Local Government Authorities, and Corporations, are offered excellent side lines in Enamels, Varnishes, Paints, &c. Liberal commission—Box 2156, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

Drawings, Tracings &c.

ACCURATE QUANTITIES PREPARED by London Surveyor of experience in shortest possible time; reasonable terms; provincial work undertaken; jobs measured up and settled in town or country.—SURVEYOR, 2, Minster Rd., London, N.W. 2262

AN ARTIST and DRAUGHTSMAN is prepared to undertake Architectural Drawings or Designs for manufacturing firms, either in office or at home. Perspectives, Illuminated Addresses, &c.—E.S.B., Box 1813, BUILDERS' JOURNAL Office, 6 Great New Street, Fetter Lane, E.C.

ARCHITECTURAL DRAWINGS, TRACINGS, &c., effectively executed by experienced Draughtsmen; very moderate terms.—STONE & COLQUHOUN, 6, York Buildings, Adelphi, W.C. 2189

ASSISTANCE rendered in the preparation of Architectural Drawings, &c., at advertiser's own address.—Box 1717, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

DRAWINGS from rough Sketches, Designs, Details, Specifications, Drain Plans and Quantities Prepared; terms moderate.—J. W., 8, Rylett Crescent, Shepherd's Bush, W. 2207

PERSPECTIVES AND ELEVATIONS, Pencil, Ink, Monochrome or Colour. HART & COXON, 14, Clifford's Inn, Fleet Street, London, E.C. Established 14 years. Specimens sent.

"PRACTICAL STENCIL WORK."—A Guide to Designing and Cutting Stencils and executing stencil work for all purposes. Illustrated by many examples of ornamental stencil designs. Just Published. 3/-. "PRACTICAL GILDING, BRONZING AND LACQUERING," 3/-. Prospectus free. "THE DECORATOR" OFFICE, 365, Birkbeck Bank Chambers, London, W.C.

QUANTITIES AND SPECIFICATIONS ESTIMATES. (Nominal fee if unsuccessful). Experienced General Assistance, Competitions, Designs, Contract, Detail, and Working Drawings—Address, QUANTITY SURVEYORS, 21, Liverpool Street, E.C.

THE BUILDERS' JOURNAL
AND ARCHITECTURAL ENGINEER.
December 12, 1906.
CONTRACTORS' SUPPLEMENT (MONTHLY).
Vol. XXIV, No. 618. **6, Great New Street, London, E.C.**

MODERN PLUMBING.—I.

With the progress in sanitation plumbing has increased in importance to the contractor. The old order when the plumber was the contractor's employee has changed. The work has now largely got into the hands of specialist firms acting as sub-contractors. Decorative leadwork has been revived and requires the services of designers and craftsmen of ability, and is quite beyond the journeyman plumber. In the same way the complication of modern sanitation and the use of special fittings which have displaced the old inefficient types, such as the D-trap, requires the attention of experts in the planning of drainage schemes for buldings, the decision of fittings best suited to special purposes and conditions, and the supervision of workmen. Fittings are almost without exception constructed by the builder no longer. Plumbers are thus becoming less directly employed by general contractors. This applies, however, more especially to large buildings, and there is much work in the way of smaller buildings and repairs where special work has to be done by employees of the builder, and it is the purpose of the present article to call attention to modern sanitary fittings and plumbing details, the work of specialists and the latest practice generally.

The word plumbing is broadly interpreted to include such details as are fixed by the plumber in conjunction with lead work, but we are compelled to exclude work in other metals than lead, often carried out by the same craftsman as the plumbing, but which is primarily distinct from leadwork. The plumber, of course, originally obtained his name from being a worker only in lead, and we shall in the main conform to this view.

Leadwork is used in various ways, but they chiefly group under the main heading of conduction or carriage of liquids, which is divided into three sections :—

1.—The removal of rain water.

2.—The removal of contaminated liquids, such as waste water and sewage.

3.—Water supply.

In the provision of means for disposng of rain water by leadwork we are concerned with external plumbing, consisting for the most part of time-honoured details and methods that do not come within the scope of the present article, which we have confined to modern work. However, so far as some details are concerned there is a distinct modern treatment to be considered—namely, decoration. Considerable attention has been paid of recent years to the design of rain water heads, and cast-lead cisterns are being again favoured. We shall return to this aspect later and illustrate some examples of modern decorative leadwork. The services of plumbers are undoubtedly utilised to the greatest extent in connection with sanitary work and water supply. The latter is most appropriately dealt with first.

Water Supply.

In cities and towns it is desirable to have the water mains in streets charged with water at high pressure to supply hydrants in case of fire, but this high pressure is an objection in buildings as it necessitates heavy pipes, strong fittings, &c. To overcome this there are pressure reducers on the market. We illustrate in Fig. 1 Barton & West's patent, made by the Lambeth Brass and Iron Co., Ltd. This reducer is compact and simple. It is fixed between the main and the building, or just inside the building, and it will reduce the pressure to one-third, one-half, or any desired fraction of pressure in the main. In altering districts for constant supply the use of this reducer will very often render the provision of stouter pipes and stronger fittings unnecessary, and, consequently, save considerable outlay. Its construction is fairly obvious from the illustrations given.

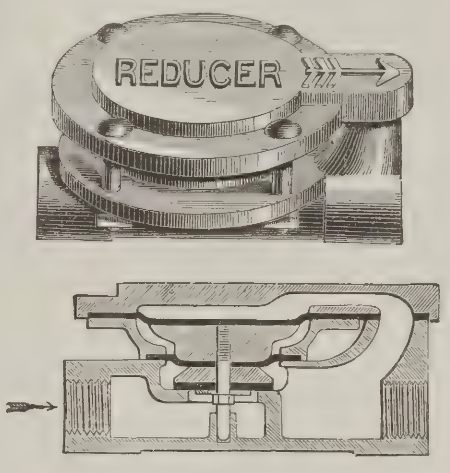

FIG. 1.

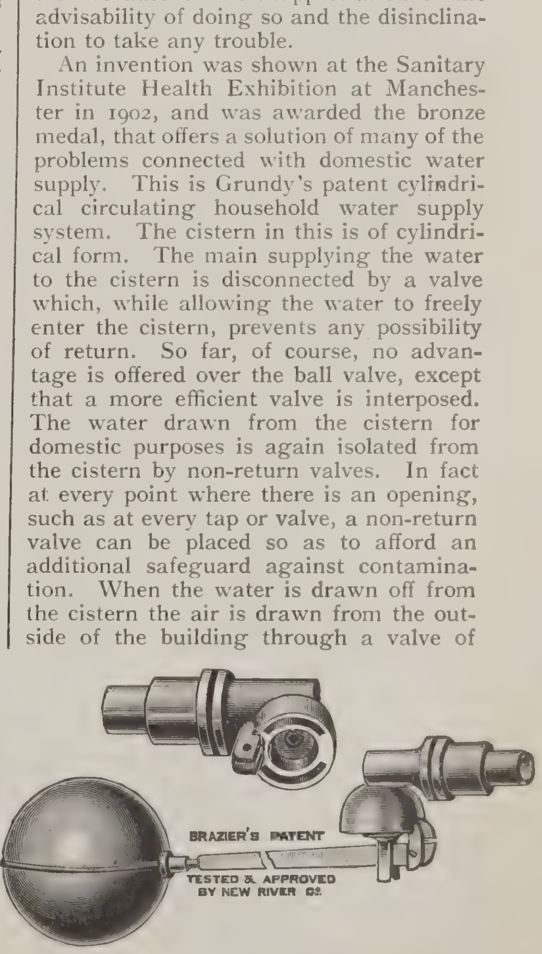
Taking the subject in the natural order, we come, after passing the main, to the storage of water in cisterns. The details connected with the cisterns have undergone little modification as a whole by the efforts of specialists. The subject seems to have, with the majority of sanitary engineers, reached its climax with the invention of the ball valve. The ball valve is rather a crude arrangement as ordinarily used. It is effective, of course, to a certain degree, but it is sensitive and easily becomes perished in course of time, necessitating repairs. The ball valve when it gets out of order lets the water run to waste. Frost is a danger that affects the cistern, perhaps, first of all, because it is generally placed in a position most liable to be so influenced and the ball valve become ineffective.

Fig. 2 shows an improved ball valve of the latest type, supplied by Messrs. F. J. Brazier & Son. This valve delivers twice as much water as the ordinary ball valve. It has a large outlet for the water after it has passed the seating of the valve, and it has no cup leathers or packing to get out of order.

As regards the main cistern itself, it is insanitary in construction. Being open to the air, as it very often is, it allows of the accumulation of filth in the way of dust, which contaminates the drinking water; and if, on the other hand, the cistern is effectually sealed against the entrance of dust, it is difficult to clean out, which it requires at regular intervals owing to various causes. It is impossible to effectually seal the cistern, because the drawing of water away from it creates a vacuum which has to be made up by the entrance of air. It is possible to provide that this air should be drawn from the open, but customarily this is taken from the apartment in which the cistern is placed, and as this is often in the roof without any light or proper ventilation, the air is here stagnant and often overheated and full of germs, for the air which is breathed by the occupants of a dwelling ascends to the top of a building and naturally collects in proximity to the cistern. The ordinary sanitary fittings adopted in buildings are very often ineffectual, and as a result the water becomes contaminated thereby, and the contamination, even if only slight, finds its way back into the cistern, because the latter is in direct communication with the whole of the service. Cisterns are unfortunately very seldom cleaned out by users because of the difficulty of access commonly provided, and also because of the inappreciation of the advisability of doing so and the disinclination to take any trouble.

An invention was shown at the Sanitary Institute Health Exhibition at Manchester in 1902, and was awarded the bronze medal, that offers a solution of many of the problems connected with domestic water supply. This is Grundy's patent cylindrical circulating household water supply system. The cistern in this is of cylindrical form. The main supplying the water to the cistern is disconnected by a valve which, while allowing the water to freely enter the cistern, prevents any possibility of return. So far, of course, no advantage is offered over the ball valve, except that a more efficient valve is interposed. The water drawn from the cistern for domestic purposes is again isolated from the cistern by non-return valves. In fact at every point where there is an opening, such as at every tap or valve, a non-return valve can be placed so as to afford an additional safeguard against contamination. When the water is drawn off from the cistern the air is drawn from the outside of the building through a valve of



BRAZIER'S PATENT
TESTED & APPROVED BY NEW RIVER Co.

FIG. 2.

special construction which, while permitting air to escape freely when the cistern is filling and permitting air to enter freely when it is emptying, yet effectually prevents the escape of water by floating when the water reaches the level of this pipe and stopping the opening. Due to this the water enters from the main until the pressure is equal both in pipes and cistern. The float valve referred to is a distinctive feature of Grundy's system and needs special description. It consists of a cone shaped somewhat like a cartridge. Due to its shape this always floats with the point upwards, so that it cannot get displaced and always accurately stops the opening when lifted by the water. When it is not floating with the water, of course, it falls back so as to permit the air freely to pass.

In regard to the question of ordinary stop valves or water taps used on the water supply system, there are many patterns. These are generally described as plug valves and screw-down valves. The former comprises the simple plug cone with a hole which is placed across the passage-way or in a line with it by a half-turn, or the self-closing type in which the plug springs back to block the passage when let go. These both close so quickly that they strain the pipe by causing water hammer. A diaphragm valve is of the screw-down class. The most common class of screw-down valves consist of those in which the opening is gradually opened or closed by screwing down the plug. To this class belong the famous Kelvin metal tap shown in section in Fig. 3. This tap, of course, has the merit of not requiring washers or packing, the opening being effectually stopped by means of the metal surfaces grinding upon each other so as to preserve even contact. Another valve belonging to the screw-down class is Fig. 4, made by Messrs. Guest & Chrimes, of Rotherham.

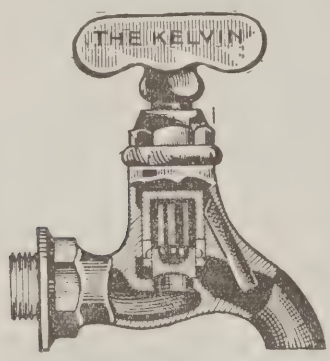


FIG. 3.

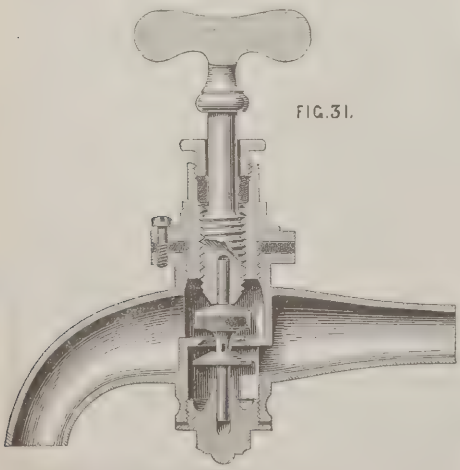

FIG. 4.

This cock admits of being immediately repaired without turning off the water. The stop is loose, as will be seen from the section. The jumper or loose stop is sometimes made so as to encase the packing or seating material with metal, this being done to protect the edges. The valve shown in Fig. 5 is useful for preventing burst pipes and obtaining water direct from the main. By its use a supply of water can always be obtained from the main pipe for dietetic purposes instead of from cisterns, which are very often in an unclean condition. Upon the commencement of frost the main valve should be screwed down so as to stop the water supply from the street going into the cistern. The inlet tap is then opened, thus allowing the house main pipe to empty. From the outlet tap water can be drawn for consumption. This combination stop valve is supplied by Messrs. F. J. Brazier & Son, of Seven Sisters Road, N.

In connection with the supply of water to lavatories and baths, there are other forms of valves in use. The "Noburn" improved public bath valve supplied by Messrs. J. Tylor & Sons, Ltd., is specially adapted for hospitals, asylums and other public institutions. It is so arranged that the cold valve must be opened first, as the key only turns in that direction. It then moves to the point marked on the dial "Ht." and "Cd." for tepid water and finally to full "Hot," and, on the key being reversed to "Shut" the valve closes without concussion. Another form of valve adopted for baths is the independent standard type used in connection with Roman baths. It stands at the foot of the bath, the spouts being made of suitable height and length to project over the roll rim. The waste is connected to the same standard. In connection with public institutions it is often felt to be undesirable for patients or occupants to turn the water on and off themselves, and so this is very often done by attendants from the outside of the room. A gear arrangement is fitted which extends through the wall or partition at the back of the bath and the taps are turned and the waste opened with a wheel from the outside.

Of sprays and douches there are many varieties. The valves in these cases are opened generally in the same way as ordinary water taps, but in connection with hospital fittings it is now thought, especially in operating rooms, to be undesirable to have contaminated hands placed on the fittings, and, consequently, valves are placed in positions to be opened by the feet or by the elbows of the user. Such an arrangement is shown in Fig. 6, which illustrates lavatory fittings for an operating room supplied by Messrs. Davis & Bennett, of Westminster.

Waste Water.

From the consideration of such water supply fittings we are naturally led to the disposal of waste water, and although this belongs to the section of sanitary fittings it is a distinct sub-division. The liquids to be disposed of are by no means so foul, and the waste water from domestic buildings is sometimes turned upon the gardens or fields and not into the sewer. One school of sanitary experts does not especially favour the great dilution of sewage that occurs in modern practice, but whether it will ever be decided to have a special separate system for the disposal of waste and flood water in towns is an open question. In any case waste water is sufficiently foul to require its careful trapping so as to prevent the ingress of bad air, or, indeed, its egress in positions where it would be offensive and dangerous to health.

The trap has received much attention from sanitary engineers and some experts have carried out experiments that have been particularly instructive. The majority of sanitary engineers unfortunately too seldom put their designs to practical tests before placing them on the market, and the result is that there have been, and are, many inefficient forms of traps which are advocated strongly and adopted by the unwary. Certain traps have been proved in practice to be inefficient, and these have died a natural death, but in the case of the new forms it is, of course, absurd to wait for practical demonstration by many years' use, and even then this would not provide us with the information which we desire—namely, their comparative efficiency. Among the old relics of the past, the D-trap is seldom or hardly ever seen nowadays except as a curiosity in a private museum.

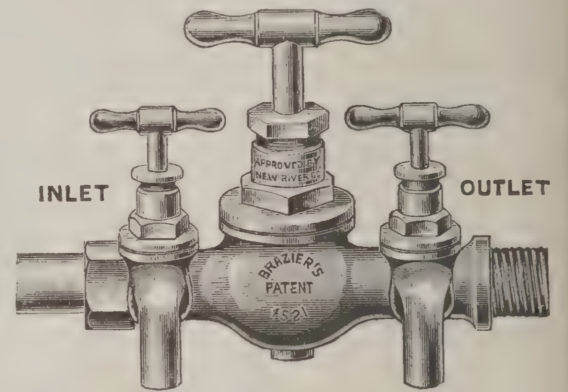

FIG. 5.

Some years ago Mr. S. Stevens Hellyer carried out a number of experiments in the flushing of traps of various forms, and he arrived at a form which gives excellent results. This he patented and called the "Anti-D" trap. The construction of this is illustrated in Fig. 7 and Fig. 8, the latter showing it in the form of a $1\frac{1}{4}$-in. trap with an enlarged mouth for sinks, baths, &c. This may, if desired, have a stopper at the bottom, as dotted in, for cleaning out. The space between the bottom of the trap and the under-side of the dip is purposely made much smaller

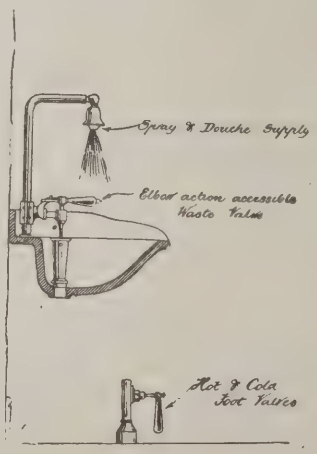

FIG. 6,

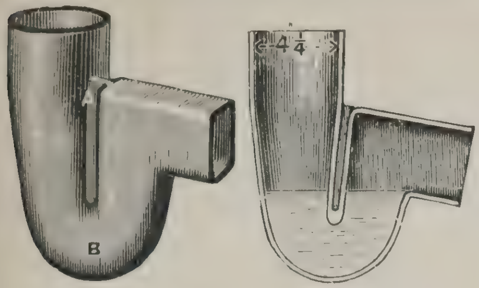

FIG. 7.

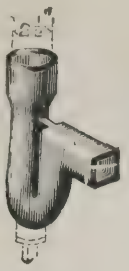

FIG. 8.

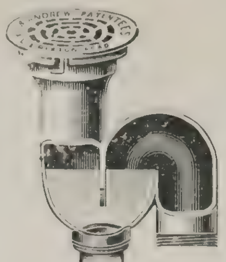

FIG .10.

than the rest of the trap to insure an entire change in its contents every time a flush of water is sent into it. The depth of the water seal is 1¾ins. These traps are of cast-lead. Mr. Hellyer also paid attention to the design of the ordinary P. and S. traps, and Messrs. Dent and Hellyer still continue to manufacture his special designs. These traps require to be vented on the top of the out-go in order to prevent syphonage. The "Anti-D" trap on the other hand resists the action of momentum and syphonage, which is liable to cause the trap to become unsealed. When, however, two or more of these traps are fixed on one stack of pipes, their branches should be ventilated to avoid syphonage.

The bath waste illustrated in Fig. 9, made by Messrs. Jackson, Elphick & Co., is in glass enamelled cast-iron. It is also made with a lead trap. The trap is made so as to sit above the floor level and it is claimed to be more easily fixed and cheaper than the ordinary brass trap. By the use of the loose flange, instead of cap and lining, the lead waste-pipe can be tafted to the trap, thus saving a plumber's joint. In fixing, the plumber has only to loosen the nuts under the flange of trap. The hanging bolts and nuts, being fixed in a screwed flange on the tail-piece, can be turned in any direction, and when placed in the position desired all that has to be done is to tighten the nuts, when the trap becomes perfectly rigid and water-tight.

It is very important that all traps should be self-cleansing. There are forms on the market which leave what might be called a back-water in the direct flow of the flush where the water remains stagnant and consequently is not changed by each flush and allows sediment to collect. This criticism is particularly applicable to many forms of gulley traps. Sometimes these have a cup-shaped receptacle placed in this back-water which can be easily drawn out of the trap and the sediment removed, but in our opinion all such forms are inadvisable of adoption, except in circumstances where large clogging objects are liable to be washed down the gulley, such as in stables. Though a trap may allow of being cleaned out easily, the public is incapable of appreciating the importance of this and leave the filth to collect and become offensive, resulting in danger to the health by the effluvia of this collected filth passing up the pipe into the house.

With lavatories, however, the grease from soapy water, &c., is the means of causing sediment to collect and occasionally obstructing the passage even in the best designed self-cleansing traps, and, consequently, it is advisable to have an opening provided which will permit of the trap being cleaned out, such as the small stopper referred to above at the base of a lavatory waste shown in Fig. 8 and also shown in Fig. 10, which latter is Tye & Andrew's patent trap, supplied by the Lambeth Brass & Iron Co., Ltd. It is made in cast-iron galvanised, with a brass grate. This grate is either secured with a clip (as seen in our illustration) or simply screwed in. It is advisable to remove the grease before it enters the drain and grease traps are adopted with the object of collecting the grease upon the surface of the water in the trap and prevent it from passing down the drain. It is no doubt well to remove the grease, and drains are often choked by the accumulation of grease, but the grease wants to be carefully attended to. We need not refer to any special forms as there is not much innovation with regard to them, while they are of secondary importance. They unfortunately in the nature of things come under the category of traps which interrupt the flush and often provide a stagnant back-water where sediment can collect.

Among the variants upon the plain self-cleansing trap are several forms of double traps and traps with check valves. The double trap is, of course, a good thing in its way, but it undoubtedly checks the force of the flush and renders the trap less self-cleansing by thus breaking the force of the discharge. Those double traps which provide the possibility of collection of sediment are of course undesirable. As regards the traps with check valves, these again have the danger of interrupting the flow and break the full force of discharge. The check valve consists of a ball which is made to seal over the passage-way to the waste pipe when this is out of use. This ball, therefore, interposes a second seal to prevent the ingress of contaminated gas, and so far is good.

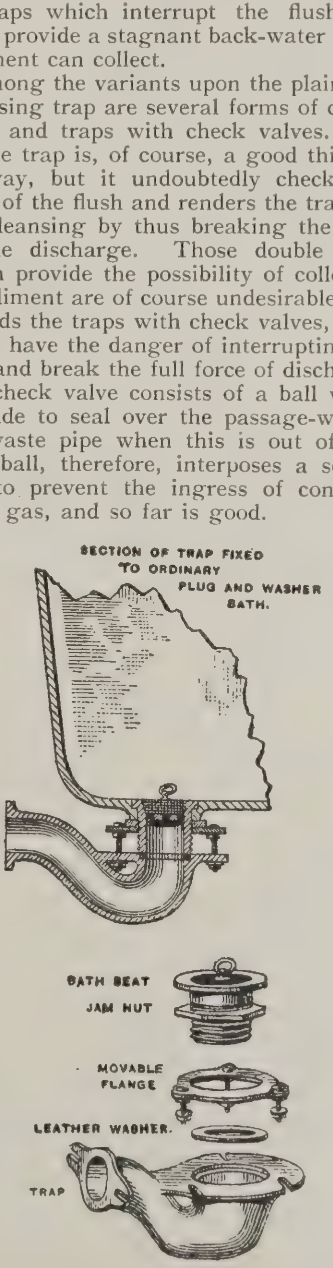

FIG. 9.

The chief point to be guarded against in connection with traps is syphonage. It is a matter of common knowledge that when a discharge of water takes place in a drain or waste connected with a long pipe, the water is liable to be drawn from a trap and break the seal. Where several traps are attached to one pipe, the falling water, of course, blows the air in front of it through the trap. To obviate both these things happening an anti-syphonage pipe is provided which communicates from the outer side of the trap to a separate air pipe vented into the open air.

There is another point in connection with traps which needs to be prevented—namely, the danger of back-flow. We often hear of houses which are flooded by the water rising in the sewer and running back into the houses and buildings in communication therewith by means of the intercepting trap. A back-flow valve should, therefore, be provided. This sometimes consists of a flapper over the opening, but a newer form which offers special advantages has been invented by Mr. D. Grundy. This is known as "The Only." We give in Fig. 11 a view showing the principle of this trap. The hollow float A permits the flow to pass readily, but any back-flow is prevented by this being forced into the opening E. The nose of this float owing to its peculiar shape is pushed up by the flow in one direction, and it cannot be displaced by a back-flow as it always returns to the correct position. An ordinary intercepting trap with this peculiar shape valve is also made. In this case the float is in a chamber with its flat base downwards. If the water from the sewer rises, this float is raised until it blocks the opening by which the sewage or waste water enters the sewer.

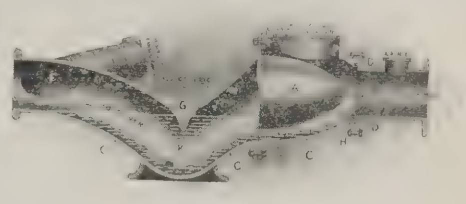

FIG. 11

(To be concluded.)

The Building Trade at Newcastle-on-Tyne—It is stated that many years have elapsed since the local building trade was so slack as it is now. For some considerable time there has been a dearth of the big contracts which keep the trade going. Hence a large proportion of those workmen who follow the building trades are without employment. So far as can be seen, there is no sign of a revival—even when the spring comes round. But the speculative builders are fairly busy.

The Scarborough Master Builders' Association held its annual meeting last month. The officers for the ensuing year were elected as follows:—President, Mr. R. H. Carr; vice-president, Mr. O. Smith; secretary and treasurer, Mr. F. Hardgrave; and auditor, Mr. W. Malton. Mr. A. W. Sinclair (senior vice-president of the Yorkshire Federation of Building Trade Employers) was again appointed to represent the Scarborough Association, and also as the representative to attend the meetings of the National Federation of Building Trade Employers of Great Britain and Ireland.

The Month's Trade

Reports by our Special Correspondents.

THE CLAYWORKING INDUSTRY.

Now the winter has come we can see that the small improvement manifested in the brick and tile trades for the past six months is not a temporary one, but is merely the first stage of a steady upward movement, for employment has even improved on the previous month, whereas in the natural course of things it ought to have fallen off. These trades badly needed it, perhaps more than any other branch of the building trade, and there is every prospect that next year if there is not exactly a boom trade will be good. The improvement in the general trade of this country was bound sooner or later to have its effect upon the building trades, and many branches have felt it already to a considerable extent, but the clayworking industry seemed to hold back. It is now going ahead, and its consequent progress may be all the more rapid because of the check. As we have before remarked, the improvement is most noticeable in those districts where the general trade is booming—*i.e.*, the cotton and engineering districts. Some agricultural counties have also done well and the clayworking trades are fairly employed there also. Employment in South Staffordshire has been fair during the past month and better than in the previous month and a year before, but in the Birmingham district and in Shropshire no improvement is yet noticeable. Employment has continued slack in the Peterborough district and at Nottingham. At Sheffield employment is reported as moderate. In South Wales and at Oldham the brick and tile trades have found employment good. At Ipswich, Sudbury and Chelmsford employment has been fair, and it has been reported as moderate in Devonshire.

THE STONE, GRANITE, MARBLE AND SLATE TRADES.

These trades seem to be well employed considering the season. The mild weather has no doubt helped matters to some extent, but trade is undoubtedly better, and next spring there will be many large contracts decided, while no doubt small orders will be more numerous. Employment is, of course, now slackening off for a few months.

Employment in the limestone quarries in Cumberland, Weardale and South Durham has continued good. It has been fair in the Buxton district and also in the Plymouth district.

The Rowsley sandstone quarries have been fairly employed. The quarries in the Sheffield district and at Barnsley have been moderately employed. At Normanton the quarries have been slack. At Gateshead employment has been moderate, and has remained bad in Forfarshire.

As regards the granite quarries, employment has continued fair in Aberdeen and good in North Wales; it has been slack in Leicestershire, Devonshire and Cornwall.

In regard to sett-making, employment has continued fair in Aberdeenshire and good at Glasgow, but at Airdrie it has declined, while it is bad at Edinburgh. In North Wales employment has been good, while it has been fair in the Clee Hill district. At Stoney Stanton (Leicestershire) employment has been dull.

Employment has continued fair in the Clee Hill road material quarries, and chert quarrymen in Derbyshire have been well employed, overtime being worked.

Messrs. Stewart & Co., of Aberdeen, have been negotiating for some time past with Messrs. Robert Thomson & Sons, Creetown, of Kirkcudbrightshire, with the view of purchasing their granite quarry and working plant. A settlement has now been arrived at, and a new 21 years' lease obtained of the quarry by the purchasers. The quarry has been bought with the probable view of forming a company to develop it on a more extensive scale. It is situated on the Fell Hill, overlooking Wigtown Bay, off the Solway Firth, so that the granite can be shipped to all parts of the west coast of England. It is, of course, not a new granite, being well known in many large towns. It has been worked for over 50 years. It is clearly distinguished from many other granites by its whiteness.

It may be interesting to note that Creetown is a large granite-producing district, there being several firms carrying on business there, including the Mersey Dock Board, the Scottish Granite Company and the Carsluith. The total quantity of granite produced in 1905 in Kirkcudbrightshire, which includes all parts of the county, was 63,882 tons. The Creetown quarries were first opened by the Mersey Dock Board some 80 years ago, and these quarries continue to be worked by that board chiefly for granite for their own use. These quarries produce all kinds of stone suitable for building, monumental and paving purposes.

There is no movement to report in the slate trade; it is simply sluggish. The larger quarries are on the whole badly employed. It is to be hoped that trade will take a turn for the better in the spring for the past year has been very slow. Employment during the past month has been reported as fair in Carnarvonshire, and quiet in Merionethshire and at Ballachulish in Argyllshire.

The returns for imports of stones, slabs and marble, rough, hewn and manufactured, for the month of November, 1906, as compared with the same month in 1904 and 1905, are as follows:—

Tons.			Value.		
1904.	1905.	1906.	1904.	1905.	1906.
112,497	103,923	90,436	£116,132	£106,366	£105,117

THE PORTLAND CEMENT TRADE

The position of the Portland cement trade has undergone but little change since we last wrote. Prices, if anything, are inclined to be somewhat firmer and the demand for the time of year is said to be satisfactory. Enquiries for new constructional works of some magnitude are fairly numerous, while general trade is distinctly better than it was a year ago. A good deal depends upon the question of stocks at works. It is well known that many manufacturers have practically empty warehouses at the present time, and if the export demand continues as good as it is just now, it appears certain that the aggregate stocks in the country next spring will be abnormally low. This is bound to result in advanced prices. The striking feature in the trade continues to be the activity in the foreign and colonial markets. This is not confined to any market, but is well spread all over the world; in fact, countries which for years past have been considered self-supporting in the matter of cement have been calling for outside supplies. It must be many a long year since Japan imported any foreign cement, but we hear of an order having been secured by a British manufacturer a few weeks ago for shipment to Yokohama. The Pacific Coast of North America, Brazil, Chili and the Argentine are taking substantially larger quantities than usual, while reports from the Continent speak of the enormously increased demand which now exists in all the leading countries. Prices which are already well in advance of those obtaining here are being rapidly advanced, and many of the Belgian and German artificial makers are fully sold well into next year. The activity in all the leading trades in this country is bound to make itself felt in the building and contracting trades before long, and in Lancashire and other districts signs are not wanting that this is already happening.

The returns of imports and exports of cement for building and engineering purposes for November, 1906, as compared with the same month in 1904 and 1905, are as follows:—

IMPORTS.

	1904.	1905.	1906.
Tons - -	24,644	18,778	11,940
Value - -	£35,137	23,478	16,384

EXPORTS.

	1904.	1905.	1906.
Tons - -	34,767	37,856	57,842
Value - -	£58,002	59,668	88,903

THE IRON AND STEEL TRADES.

There has been a steady improvement in the demand for both pig-iron and manufactured iron and steel during the past month and prices have continued to advance. To some extent the rise in price has been caused by an increase in the price of fuel, but American and German demands for export in pig-iron, to which we referred to last month, have been so heavy, continuing instead of falling off, that, combined with an increased home and ordinary export demands, the advance has been considerable. The stocks at the public stores are much reduced and makers have practically no stocks on hand. The increased value of pig-iron has reflected on the manufactured iron and steel market and raised prices. There is, however, an increased demand in this branch which alone would have sufficed to raise prices.

The settlement of labour troubles on the Clyde has also helped matters and the prospects are of the brightest. Makers are not reaping full advantage of the present advance, for they are fulfilling orders given some time ago at lower prices. They seem now to desire to reap advantage from the almost certain advance that will take place, and are disinclined to book orders too far in advance at present prices. The demand for pig-iron promises to keep makers hard put to meet it next year, while the rolling mills have orders booked well into next year. Great as has been the boom this year, next year promises to be still better.

As regards Lancashire, the demand for pig-iron has been so considerable that the local market is in an excited state. Prices have been helped upward by speculative buying. Finished iron has similarly advanced.

In South Staffordshire prices in both pig-iron and manufactured iron and steel have both risen—but it is thought that they will now remain practically stationary for a few weeks in consequence of stock-taking.

The North of England market is booming most of all. The stocks of pig-iron at Connal's stores at Middlesbrough are greatly decreased. It is stated that the quantity of pig-iron unsold in maker's hands has not been so small for 14 years. The exports from the Cleveland district in November established a record. The total was 144,741 tons. Of this Germany had 37,145 tons, the United States and Canada 33,040 tons, Italy 13,751 tons, Belgium 5,504 tons, and France 3,082 tons. Manufactured iron and steel prices are also advancing.

In Scotland pig-iron is in good demand and trade in manufactured iron and steel is very satisfactory.

As regards the foreign market, the United States and Germany seem unable to supply the home demand. At any rate, they are buying considerable pig-iron from England. In Belgium manufactured iron is in strong demand and prices in the home market are advancing. The low price of English joists has kept down the export price of Belgian joists, but the former having now advanced we may look for an advance in Belgian prices at any moment.

The returns for imports and exports in certain branches of manufactured iron and steel for the month of November, as compared with the same month in 1904 and 1905 are as follows:—

		Imports.			Exports.		
		1904.	1905.	1906.	1904.	1905.	1906.
Puddled Iron	tons	10,189	17,330	9,833	68,941	82,748	182,072
Wrought iron, in bars, angles, rods and sections		11,172	13,541	8,142	8,913	11,040	14,104
Rails		3,442	389	812	37,436	45,357	45,369
Steel:—Girders, beams, joists and pillars from Belgium		7,486	9,294	4,212	4,075	6,553	7,863
" " " " other countries		1,422	2,507	2,685			
Ingots, blooms, billets, slabs, sheet bars, tin plate bars, or similar partly manu actured		34,762	60,122	25,527	326	1,330	1,500
Bars, angles, rods and shapes or sections		12,825	4 680	1,551	10,868	14,298	24,175
Galvanized sheets (flat or corrugated)		—	—	—	36,194	38,113	43,931

OTHER METALS.

Copper is very strong, and as the production seems unable to keep pace with the demand prices may continue to advance. The mines are extending their facilities for manufacture, but it is unlikely that they will be so advanced as to be able to produce a greater quantity next year than this.

The tin market is in an intrinsically strong position and prices are maintained despite speculation.

Lead fell off in price in the middle of last month, but prices have advanced again.

THE IRONMONGERY TRADES.

Employment in the lock and latch trades at Wolverhampton has continued bad. With hollow-ware turners it has remained good, and with cast and light hollow-ware and iron fence and hurdle makers it has been fair. It has continued slack with hollow-ware stampers at Sheffield, and quiet at West Bromwich with hollow-ware makers.

Employment has continued quiet in the stove, grate, &c., trades at Rotherham. It has been fair at Falkirk with stove fitters and dull with moulders, and bad at Glasgow. It was fair at Leeds, Newcastle and Gateshead.

Employment has been fairly good with nut and bolt makers at Winlanton and Birmingham; and at Dudley and Darlaston it continued good. At Birmingham it has been fair with nail and rivet makers. At Blackheath it has been quiet with rivet makers and bad with nail makers.

Employment has continued good generally with wire makers and workers.

The return for imports and exports for November, 1906, as compared with the same month in 1904 and 1905, are as follows:—

	Tons. 1904.	1905.	1906.	Value. 1904.	1905.	1906.
Imports.						
Wire nails	3,143	4,085	3,193	£33,823	40,754	35,164
Nails (other than wire nails), screws and rivets	1,118	1,200	679	19,922	22,652	13,050
Bolts and nuts	474	431	316	7,705	7,950	5,723
Exports.						
Nails, screws and rivets	1,934	2,091	2,383	35,813	42,361	42,547
Bolts and nuts	1,590	1,545	2,336	24,878	26,472	36,958

THE WALLPAPER TRADE.

The wallpaper trade continues to show next to no movement. The Board of Trade returns for exports and imports for the eleven months of this year, ending November, show that the importation of paperhangings is about 20 per cent. greater than last year; the exports have improved less—namely, about 5 per cent. better than last year.

The following is the return of paperhangings for November issued by the Board of Trade:—

	1904.	1905.	1906.
Imports.			
Cwts.	—	5,479	5,771
Value	—	£13,293	15,172
Exports.			
Cwts.	3,841	5,697	5,728
Value	£11,893	14,834	13,503

The annual general meeting of the shareholders in the Wallpaper Manufacturers, Limited, was held at the end of last month. The report of the directors shows that, after payment of interest on debenture stock, interim dividend on preference shares, providing for depreciation and bad and doubtful debts, and including £128,385 2s. 1d. brought forward from last year, there remained on August 31st, available for appropriation £238,056. The difference as compared with £290,727 12s. 2d. last year is principally in consequence of £50,000 being already deducted from profits this year as a special appropriation for loss on closed branches, and the liquidation of Page, Arnold & Co., Limited. This is in addition to the usual depreciation of £30,000. The final dividend on the preference shares, amounting to £24,902 16s. 6d., was paid October 31st. A dividend at the rate of 8 per cent. per annum on the ordinary shares was declared. This amounts to £87,649 13s. 7d., and the balance, £125,503 9s. 11d., will be carried forward to next account. The actual profits on the year's trading are £228,908 8s. 2d., as compared with £243,227 4s. 4d. last year; the difference, the chairman stated, is accounted for by the low prices which have ruled, and an increase in the cost of paper. Part of the system adopted to reduce the cost of production has been to close certain branches, and concentrate their manufacturing at other branches. This has necessitated the storage of some machinery, the destruction of some, and the disposal of buildings at a lower price than that at which they were purchased as going concerns. The advantage will be shown in future years. The addition on capital expenditure is £62,340 7s. 6d., principally outlay on a new paper mill at Greenhithe. The mill will probably not be completed before a year hence. It may be that the opposition to the Soap Trust led the chairman to defend the Wallpaper Combine, for he said that the amalgamation of several firms in such a trade as theirs was necessary, in order to effect economies in the cost of production and distribution, and as this enabled them to quote low prices for goods the public participated in these economies, whilst they were also enabled to pay due regard to the interests of the merchants, as it was upon their success they wished to establish their own.

THE GLASS TRADE.

The glass trade is moderately good. With sheet glass makers and flatteners at St. Helens employment has continued good; with pressed glass makers on the Tyne and Wear it has remained moderate; with glass blowers in London it has been fairly good.

The returns for imports and exports of glass for the month of November, 1906, a compared with the same month in 1904 and 1905, are as follows:—

	Cwts. 1904.	1905.	1906.	Value. 1904.	1905.	1906.
Imports.						
Window and German Sheet, including shades and cylinders	69,706	143,782	123,212	£40,141	82,895	59,119
Plate	31,120	31,163	30,160	37,888	41,661	36,875
Exports.						
Plate	11,325	10,586	13,551	15,904	17,558	20,236

THE PAINT TRADES.

The paint trades continue fair. As regards materials, the returns for imports and exports for November, 1906, as compared with the same month in 1904 and 1905, are as follows:—

		Quantity. 1904.	1905.	1906.	Value. 1904.	1905.	1906.
Imports.							
White lead	Cwts.	25,382	32,516	23,628	£20,259	27,525	22,828

THE TIMBER TRADE.

London Market in November.

The weakening of the London wood market continued through November, though on a lesser scale than in October. Messrs. Churchill & Sim report that the stock accumulating is too large for the market requirements; but it is a cheap stock, and, so far as a 6 per cent. Bank rate will allow, it is a stock worth holding. The importation from Russia, Finland and Norway has again been large. From Sweden it has been moderate, especially as regards prepared boards. The consumption continues miserable, the dock deliveries again being more than 2,000 standards below those of November last year; but the over-side deliveries are larger by 3,100 standards, bringing the total of the month's trading to the right side by about 1,000 standards. For next season a very large business has again been effected by Swedish, Russian and Finnish shippers with Continental markets at very high prices. These sales are no doubt for special specifications; but they are none the less for specifications coveted by British buyers, and by them the market for next year for battens and all small sizes at high prices is already assured. For deals the prospect seems to hinge on the White Sea stocks. If these shippers hold for more than they can get, as they are in the habit of doing, the Swedes will probably take the business at about the prices they are now asking. If on the other hand the Russians sell cheaply it would seem as if there were no intrinsic reason why, with the Cape market still out of the way, the Swedes would not have to follow them, and in that case they would hardly be able to sell out their deal stocks at more money than they have obtained this year. So far as this country is concerned very little business has so far been effected for next season, beyond a few sales of Finnish battens, which read cheaply in comparison with Swedish quotations, and practically the whole of the available firewood stocks, which have gone off at great prices.

Messrs. Denny, Mott & Dickson's report is as follows :—" Neither the weather nor business were cheerful during November. However, notwithstanding the grave handicap of tight and dear money, a quietly steady all-round trade was done, and probably the greatest handicap to the volume of timber business is the heavy advance demanded by the shippers for most descriptions of wood on the grounds of the magnitude of the consumption of timber in the United States and South America and the decrease in the forest supplies generally, but whilst these pleas are more or less sound, the position is not free from the taint of an artificial scarcity being created by rings or monopolies."

The abstract of dock stock, consumption, &c., for November, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stock.

The stock of wood in the public docks on November 30th was :—

	Pieces.
Foreign deals and ends - - - -	2,515,000
Do. battens - - - -	3,672,000
Pine deals and battens - - -	752,000
Spruce do do. - - -	1,042,000
Boards, rough - - - -	4,942,000
Do. prepared - - -	6,994,000

totalling 19,917,000 pieces, as against 17,623,000 in 1905, 19,838,000 in 1904, and 23,391,000 in 1903.

In other kinds the stock was as follows :—

Foreign wainscot logs - -	239 pieces.
Do. oak timber - -	899 loads.
Do. fir timber - -	3,521 do.
Do. Oregon pine, &c., spars and masts - -	3,809 do.
Colonial oak timber - -	530 do.
Do. birch timber and planks -	6,576 do.
Do. elm and ash timber -	948 do.
Do. yellow pine - -	1,136 do.
United States pitch-pine timber	18,083 do.
Do do. deals -	63,000 pieces.
East India teak - - -	7,230 loads.

Deliveries.

The deliveries have been—

	First eleven months. Pieces.	Nov. Pieces.
Foreign deals and ends -	2,874,000	268 000
Do. battens -	4,401,000	387,000
Pine deals and battens -	879,000	67,000
Spruce do. do. -	977,000	75,000
Boards, rough -	4,425,000	397,000
Do. prepared -	12,096,000	964,000
Total -	25,552,000	2,140,000

The deliveries direct from ship to craft have been—

	First eleven months. P.s.h.	Nov. P.s.h.
Deals and battens - -	119,427	10,615
Boards - - -	22,771	2,320
Total -	142,198	12,935

Soft Woods.

Swedish Deals, Battens and Boards.—The fresh arrivals from the Swedish ports have been on a very normal scale for deals and battens. Prices have, however, fallen lower than in October and battens have again fared rather the worse of the two. Of prepared boards the importation was a very small one for November, and in the absence of pressure to sell this has quite checked the tendency to any further weakness in spite of the poor consumption.

Norwegian Boards.—There was again a large arrival of prepared Norwegian boards during November. This has not, however, affected the market any further; they have gone off with ease and without any change from the quotations of last month.

Russian Deals and Battens.—There was also a large importation of Russian deals and battens into London during November. The consumption has been insufficient to carry off this supply except at a further reduction in the prices realisable, and quotations are now under those to which they fell in October.

Finnish Battens.—The supply of Finnish battens during the month was rather more than double that of November last year. Prices have continued to weaken, and as yet show no sign of recovery. There is a sharp rise ahead of them when the turn comes.

Prussian Timber.—There was no fresh arrival of fir timber during the month, which seems to have awakened this market to some of the elements of the situation, prices having risen quite sharply for such retail quantities as have been enquired for. The demand for oak timber has fallen away again in volume, but rates are still on the upward grade for such small quantities as are passing into consumption.

Canadian Timber.—There is no change to report in the pine deal market in London, prices remaining at about the same levels as before. The fresh arrivals have been almost negligeable. For spruce this market has dropped a point consequent on a very poor demand and rather freer arrivals from the St. Lawrence. The Lower Ports have only sent us a handful, but the c.i.f. quotations are hardly so strong. Birch cheered up quite appreciably during the month, but oak, elm, ash and yellow-pine were all neglected. There was no fresh arrival of pitch-pine timber or planks in London during November. The deliveries of sawn timber have kept going very well and the dock stock is shrinking again. Prices are up 3s. or 4s. a load and would go higher but that the very high quotations ahead show signs of weakening here and there for next year's shipments. For planks also prices are a turn or two better and this stock also decreased during the month.

Hard Woods.

Teak.—Messrs. Denny, Mott & Dickson report that the landings in the docks in London during November consisted of 592 loads of logs and 329 loads of planks and scantlings, or a total of 921 loads, as against 405 loads for the corresponding month of last year. The deliveries into consumption were 556 loads of logs and 382 loads of planks and scantlings—together 938 loads, as against 1,355 loads for November, 1905. The moderate landings of logs consisted chiefly of Java wood, so that the stock of Moulmein and Rangoon teak continues to dwindle, Consumers are increasingly discontented at the inadequacy of stocks to supply the quality and specifications which have been found by long experience most economical for the different classes of construction requiring teak, and substitutes for this wood are increasingly being specified. The shippers are still seeking to force up prices, and business is difficult all round, the suspicion that the short supply is aggravated by an artificial restriction by operators in India tending to increase the growing discontent on the part of the consumers.

Mahogany. — Consumption during November was steady and satisfactory looking to the very modest supplies. Honduras wood is in fair supply, but

Tobasco and African descriptions are inconveniently bare in stock. Prices have generally hardened. Messrs. C. Leary & Co., in their report on the mahogany market, say: "With a well-sustained demand and a shortage in supplies present and prospective, especially the latter, the position of our market is entirely in shippers' favour, and fresh imports of nearly every description can be recommended.

Builders' Notes.

Messrs. Patman & Fotheringham, Ltd., of Theobald's Road and Islington, have just completed the large mission hall and general offices for the Missions to Seamen at Tilbury; they are also nearing completing the rebuilding of the "Playhouse" (formerly the Avenue Theatre) for Mr. Cyril Maude, which was practically destroyed in the Charing Cross Station disaster.

The annual report of the Glasgow Master Wrights' Association, submitted at the general meeting last week, shows that the improvement in the building trade hoped for has not been realised. All branches of the building trade throughout Scotland have been specially dull. It was intimated that a Conciliation Board had been formed of an equal number of employers and operatives to adjust any differences that might arise.

The Huddersfield and District Master Builders' Association held a meeting last month for the purpose of hearing an address by the new secretary of the National Federation of Building Trades of Great Britain, Mr. White. As a result it was decided that a conference of members of the various allied trades, masons, plumbers, painters, joiners, etc., should be held at a convenient date in January next in order to discuss, and, if possible, arrange for, a combination of the various trades.

Messrs. Spencer Santo & Co., the well-known contractors, have declared an interim dividend at the rate of 6 per cent., as compared with 8 per cent. per annum this time last year. In the four years to December last, in respect of which 10 per cent. has been forthcoming, the interim dividends have been at the rate of 5, 7½, 5 and 8 per cent. respectively, so there is some justification for hoping for a maintenance of the old level when the complete results for the current twelvemonth come to hand.

Accidents in the Building Trade.—Mr. George Macfarlane, President of the National Federation of Building Trades Employers of Great Britain and Ireland, has been invited to become a member of the Departmental Committee on Accidents in the Building Trades, as a representative of the building industry for the northern portion of England and Scotland. Mr. Macfarlane is a native of Scotland, but he has been engaged in business as a builder in Manchester for the past forty years, and is familiar with the conditions of the building industry in the North. The methods of carrying on building operations vary considerably in the North from those prevalent in London and the South, and it is important that any regulations relating to the industry which may result from the report of the Departmental Committee should be drawn with a fuil knowledge of these varying conditions. Mr. W. Shepherd, of the London Master Builders' Association, is the builders' representative on the Committee for the South of England.

Bath Labour.—The men and masters in the Bath Building Trade have been working under a set of rules which provided for a 7½d. per hour wage, and these rules contained a provision for arbitration in the event of disputes arising under them. The masters desired an alteration of the rule governing winter hours. The secretary to the Bath Operatives' Joint Committee has presented to the master builders a complete new set of regulations governing all branches of the building trade in Bath and district. They embody new working rules, the shortening of hours, and increase of wages to 8d. per hour. The notice is a six months' one. The demands of the men may be formulated as follows:—Generally the effect of the proposed alteration in working hours is a reduction of half-an-hour per diem, or of three hours per week. The wages asked are, for masons, carpenters and joiners, bricklayers, plasterers, and plumbers, 8d. per hour; for labourers, 5½d. per hour, and scaffolders, 6d. per hour. Heretofore it has been generally understood that the wages paid in Bath are below the general standard. The allied trades mentioned above have not all received the same rate of pay, and a uniform scale is now proposed. The master builders will, no doubt, reply that if wages had not been lower in Bath than elsewhere employment would have been worse than it is for the operatives. The men suggest that two hours' notice be given or received upon dismissal or departure of any workman, failing which notice two hours' pay shall be forfeited or paid respectively, and that all wages due shall be paid on expiration of such notice. There is an obvious desire to discourage overtime with a view to increasing the number of men in employment by the suggestion of a rule that no overtime to be allowed except in cases of necessity, when such time shall be paid for extra. The men ask that no apprentice shall be taken on under 14 or over 16 years of age, and that no apprentice shall be bound for a less period that five years, or so that his indentures shall expire before the age of 21 years. Not more than one apprentice or improver to five journeymen of any branch to be allowed; sons of tradesmen to have preference to the trade of their father. Another rule proposes the formation of a Board of Conciliation, composed of four employers and four members of the trade affected, with two arbitrators where necessary, who may call in an umpire. Simultaneously the Bath branch of the National Amalgamated Society of Operative House Painters and Decorators are moving to a like effect. They require a minimum wage of 7d. an hour for competent workmen. They make conciliation proposals similar to those of the building trade operatives.

The Labour Market

Board ot Trade Returns for October.

Employment continued dull in October, and was worse than in September in nearly all branches. It was rather better on the whole than a year ago.

Returns received from firms employing 71,552 workpeople at the end of October show a decline in the number employed of 3,028, or 4·1 per cent., compared with a month ago. The table at top of next column summarises these returns.

District.	Number of Workpeople paid Wages on the last pay-day of the month.			
	Skilled Tradesmen.	Labourers.	Lads and Boys.	Total.
London	12,717	9,065	910	22,692
Northern Counties and Yorkshire	4,552	4,011	1,037	9,600
Lancashire and Cheshire	5,327	4,462	1,363	11,152
Midlands and Eastern Counties	4,415	4,136	628	9,179
S. & S.W. Counties and Wales	4,126	2,765	701	7,592
England and Wales	31,137	24,439	4,639	60,215
Scotland	4 308	2,857	1,097	8,262
Ireland	1,551	1,342	182	3,075
United Kingdom ...	36,996	28,638	5,918	71,552

The foregoing shows that the decline was general with very few exceptions. The decrease in the number of workpeople employed amounted to 2,022, or 5·2 per cent., in the case of skilled workmen, and to 974, or 3·3 per cent., in the case of labourers. In London the decrease amounted to 5·7 per cent. with skilled, and 3·8 with unskilled workmen.

The percentage of Trade Union carpenters and joiners unemployed at the end of October was 7·6, as compared with 5·9 in September, and 8·2 a year before. With plumbers 8·0 per cent. were unemployed, as compared with 7·8 per cent. in September, and 12·0 per cent. a year before. Employment with masons, plasterers and painters was worse than in September, but there was a slight improvement in the case of bricklayers. Compared with a year ago some improvement was reported by bricklayers and plasterers, and some decline by painters.

London.

From Trade Union returns relating to carpenters and joiners, it appears that the percentage unemployed at end of October was 9·0, as compared with 6·5 in September, and 8·8 a year before. With plumbers the percentage was 12·2, as compared with 9·2 in September, and 13·2 a year before. Employment in other branches was dull generally.

Northern Counties and Yorkshire.

Employment was dull, and somewhat worse than in September. It improved, however, with house joiners on the Wear, with whom it was good, and with painters at Hull and Hartlepool, with whom it was fair.

Lancashire and Cheshire.

Employment at Manchester was dull generally. At Oldham it was good with plumbers, plasterers and labourers, and was better than a year ago generally. With carpenters at Blackburn and Burnley it was fair; with plumbers at Bolton and Blackburn employment was good.

Midland and Eastern Counties.

Employment was dull generally. With painters it improved in the Leicester district, and it was good at Nottingham. Employment at Coventry was reported as fair.

Southern and South-Western Counties.

Employment continued dull generally.

Scotland.

Employment was dull generally, but good with slaters. With plasterers and plumbers it was rather better than in September. Employment was fair at Dundee. It was also fair with bricklayers in the West of Scotland.

Ireland.

At Belfast employment was slack generally, and worse than in September; with plasterers, plumbers and slaters at Dublin it was fair.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL ENGINEER.

December 19, 1906. Volume 24, No. 619.

NOTICES.

Offices: 6, Great New Street, Fetter Lane, London, E.C.

Telegraphic Address: "Buildable, London."

Telephone Numbers: 2200 Holborn, 2201 Holborn, 2202 Holborn and 2203 Holborn.

Date of Publication: The BUILDER'S JOURNAL AND ARCHITECTURAL ENGINEER is published every Wednesday, price 2d.

A Special Supplement is regularly presented free with the ordinary issue, three weeks out of every four. These three regular monthly supplements are entitled "Contractors' Supplement," "Concrete and Steel Supplement," and "Fire Supplement" respectively.

The "Contractors' Supplement" is presented with this issue.

The Subscription Rates per annum are as follows:—

At all newsagents' and bookstalls - - 8s. 8d.
By post in the United Kingdom - - 10s. 10d.
By post to all places abroad - - - - 17s. 4d.

All Accounts are payable to Technical Journals (1902), Ltd. Cheques should be crossed "London and Westminster Bank, Temple Bar Branch." Post Office Orders should be made payable at Fleet Street, E.C.

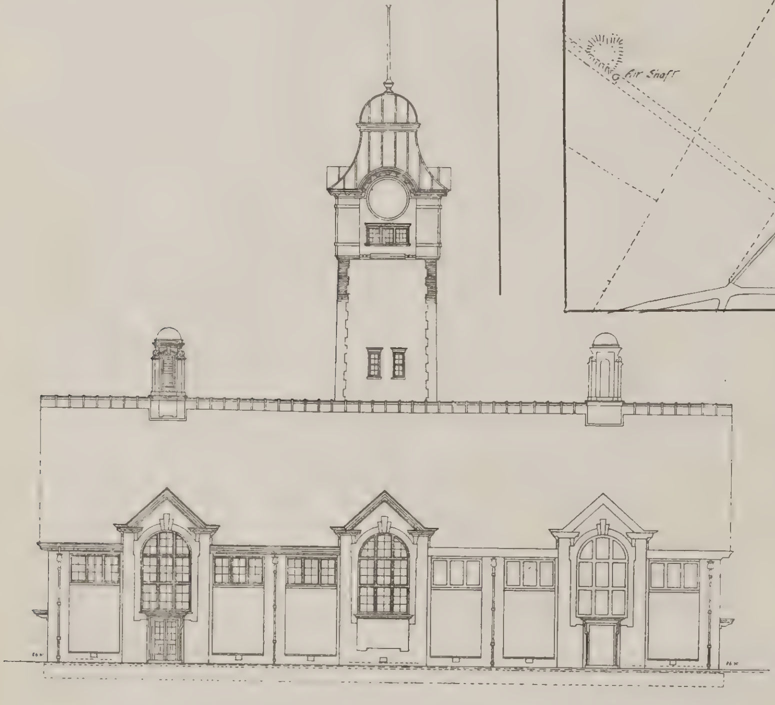
Cubic Contents and Air Supply. THE Levenshulme District Council no doubt think they have a perfection of commonsense in their argument with the Local Government Board respecting their desire to establish a building by-law to compel the provision of a minimum size in the superficial area of one living-room and one bedroom in cottages to be erected in their district. The Local Government Board refused to confirm this by-law and have stated that under the Public Health Act of 1875, and the amending Acts, the local council have no power to make such a by-law, and, consequently, if one were made and confirmed by the Local Government Board, it would be of no effect. The Council seem to be working themselves into a frenzy over what they have considered to be a national danger unrecognised by anyone before they discovered it. They hold that immediate steps should be taken to remedy the defect, as they feel it is imperative in the interest of good health that local authorities should be able to prevent the erection of cottages with a number of very small living-rooms and bedrooms. The Levenshulme Council demonstrate to their own satisfaction that "the law is a hass," for it only now allows councils to make by-laws to allow (1) for the height of rooms, and (2) for the air-space about buildings. Moreover, they argue that a local authority can make regulations prescribing a minimum cubic area for cows, but cannot prescribe a minimum area for human beings. Now though it is easy to show that there are anomalies in the various regulations, all such demonstrations tend more to show the uselessness and hardship of too stringent interference by Government enactments in the construction of buildings. The present Local Government Board wisely see that former Boards went too far, and they are not going to be moved by the Levenshulme busybodies into still further increasing the cost of building by stringent regulations for which there is no real need. The air supply in a room is not dependent upon its size. It is solely dependent upon the means of ventilation. We think it is to be regretted that local councils are allowed to regulate the minimum height. It has been proved over and over again that a room may be of ample flooring area and height and yet the air is stagnant, while isolation is the only preventive to the spread of infectious diseases. There is perhaps more reason in insisting upon a large cubic air-space for cow-sheds than there is for human habitation, because animals cannot help themselves, whereas a person has sense enough to see that he has sufficient air supply. But, as we have said, cubic contents will not ensure ventilation, and it would be far better to regulate the isolation of animals and the ventilation of cow-sheds. With reference to houses, the very necessity of providing accommodation for furniture assures a minimum of cubic contents, and, therefore, there is no need to make any regulation in that respect. If we must have by-laws on the point, let them be in regard to means of ventilation. Even then we cannot ensure that the inhabitants will not block up every entry for the fresh air, as the poor so often do in order to secure warmth and to economise fuel.

An English Parthenon. A PROPOSAL is on foot for the completion of the national monument on the Calton Hill, Edinburgh. All who know Edinburgh will recollect that the monument consists at present of only 12 Doric columns along the front. The proposal is for the completion of the building on the model of the Parthenon at Athens, to house the Scottish National Gallery. The Corporation of Edinburgh, to whom the Calton Hill belongs, thinks sufficient of the proposal to have expressed its readiness to give a site on the Hill for the National Gallery if the Government decides upon placing it there, and the Lord Provost, magistrates and council of Edinburgh have accorded as wide a circulation as possible to a pamphlet on the subject by Mr. William Mitchell, S.S.C. The matter came before the House of Commons last Friday, when the House went into Committee on the National Gallery of Scotland Bill. There was considerable discussion on the subject of the disposal of funds, and it was explained that the Government's proposals consisted in altering the building at present known as the Royal Institution, in order to make it serve as a picture gallery and accommodate the Royal Academy. The alteration of the Royal Institution building will cost about £14,000. The Royal Society, who have hitherto occupied rooms in the Royal Institution, are to be given new premises which are to be acquired for them. The School of Art, which hitherto has occupied premises in the Royal Institution building, is also to be removed to other premises. It was intimated that, although the Government does not approve of the suggestion that a site should be found for a new National Gallery for Scotland on Calton Hill, the present scheme does not stand in the way of a larger development hereafter. If persons came forward with sufficient funds for carrying out a larger scheme the Board of Trustees would be glad to consider it. We fully recognise the need for a new National Gallery for Scotland, but we do not favour the proposal outlined above. Fancy restorations of ancient buildings have nothing of the charm of the original, and how the Greek temple is to be emblematical of the Scottish nation we do not quite see. Such a copy is more suited to Earl's Court. There are capable men enough in Scotland to produce a national memorial in a national style worthy of its position and of Scottish ideals.

DUKE OF YORK'S SCHOOL, DOVER.

For many years past it has been evident that Chelsea is no longer a suitable place for the Royal Military School founded by the Duke of York at the commencement of the nineteenth century. It was decided, therefore, to remove the school to a more congenial place. Dover was eventually selected, the site there secured being of about 140 acres extent on the rolling slopes of the South Downs near Frith Farm, with an open prospect to the Channel. The school is for 550 boys, the sons of men who have served in the Army, preference being given to those boys whose fathers have been killed or who have died in service abroad. Provided the education test is passed satisfactorily, boys are admitted at about 9 years of age, they are clothed, fed and educated free of charge, and then at 14, if fit and willing to serve in the Army, they are enlisted: 90 per cent. enter the Army, while those who do not are apprenticed, placed in service, or handed over to their friends.

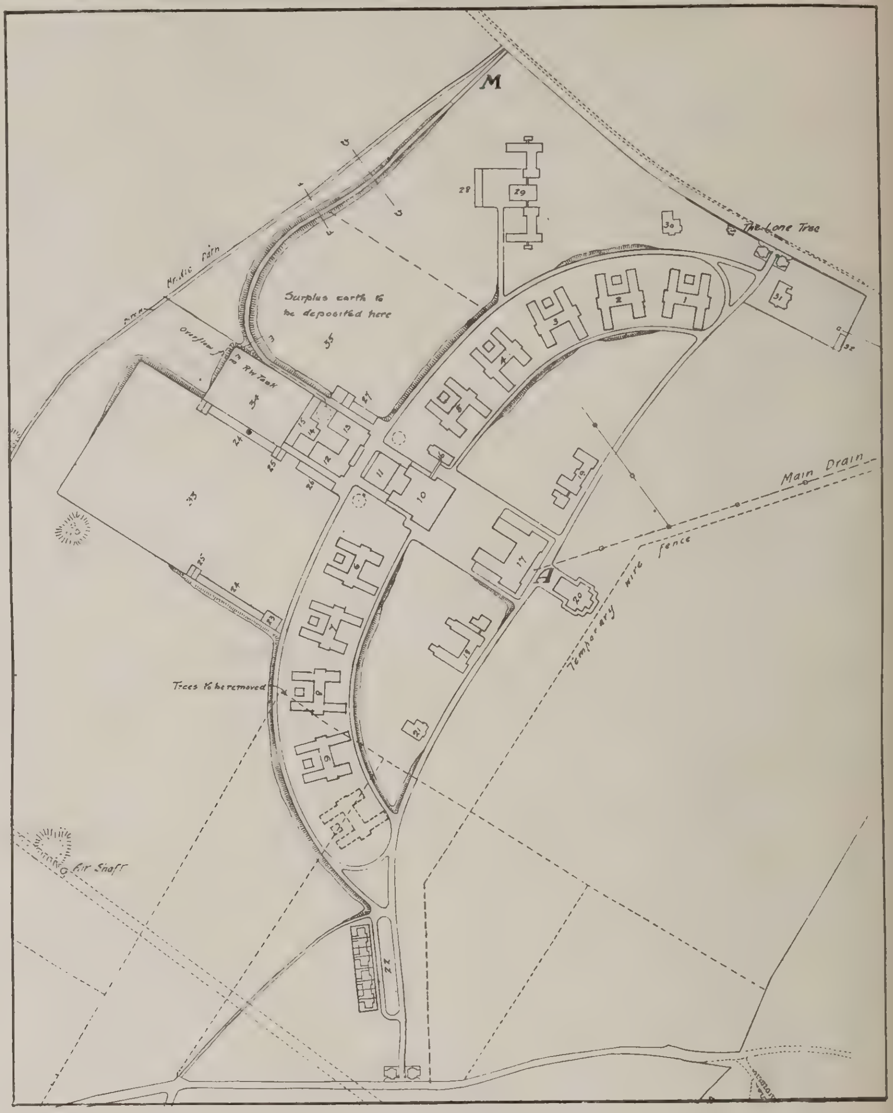
The scheme of the new school at Dover was originated by Sir Henry Tanner, Principal Architect to His Majesty's Office of Works. As the accompanying block-plan shows, it is admirably laid out, there being a central block comprising dining hall, kitchen, &c., with five dormitory blocks on either side (two of which, however, will not be built at present), school house, administration and students' blocks, with chapel in front, and swimming bath, gymnasium, boiler-house and workshops at the rear, and a hospital, mortuary and disinfecting block disconnected at one side.



SOUTH ELEVATION.

The site of the present school at Chelsea is, of course, a very valuable one; so much so, indeed, that it is stated there will be a sum of £100,000 in hand after the new school has been erected with the funds derived from the sale of the old site and buildings.

The total cost will be about £170,000. The buildings were commenced last March and should be completed early in 1908.



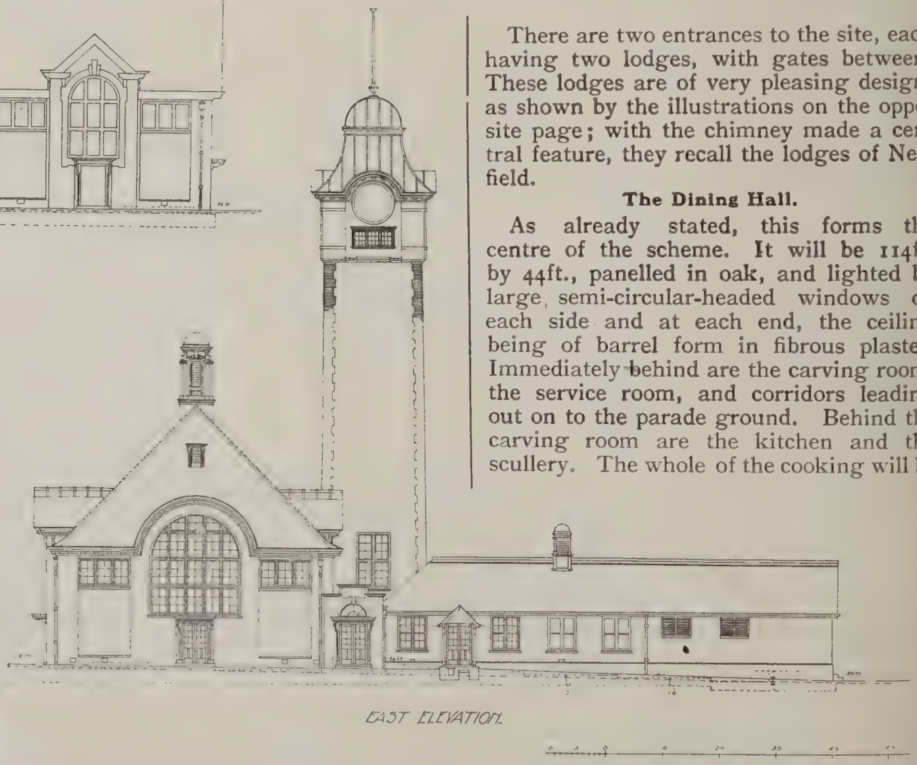
BLOCK PLAN.

1-9, dormitories; 10, dining hall and kitchen; 11, quartermaster's stores; 12, 13, swimming bath and gymnasium; 14, 15, boiler-house and laundry; 17, school; 18, students' block; 19, administration block; 20, chapel; 21, chaplain's house; 22, cottages; 23-25, playsheds, with fives-courts and band-room; 26, 27, workshops; 28, mortuary and disinfecting chamber; 29, hospital; 30, medical officer's house; 31, commandant's residence; 33, playground.

There are two entrances to the site, each having two lodges, with gates between. These lodges are of very pleasing design, as shown by the illustrations on the opposite page; with the chimney made a central feature, they recall the lodges of Nesfield.

The Dining Hall.

As already stated, this forms the centre of the scheme. It will be 114ft. by 44ft., panelled in oak, and lighted by large semi-circular-headed windows on each side and at each end, the ceiling being of barrel form in fibrous plaster. Immediately behind are the carving room, the service room, and corridors leading out on to the parade ground. Behind the carving room are the kitchen and the scullery. The whole of the cooking will be



EAST ELEVATION.

DINING HALL AND KITCHEN BLOCK.

done by gas, and six flues are provided for the gas ovens. On the western side are large stores for bread, grocery, dry goods, knives, &c.; on the east side the matron's office, the servants' hall, two extensive meat larders, wood and other stores; while immediately behind the dining-hall block are the quartermaster's stores, tuck shop and canteen. At the side of the dining hall rises the central tower, 100ft. high. It will have a clock dial on each face, and will also contain water tanks having a capacity of 8,800 gallons.

The Chapel.

This is centrally placed at the front of the site. We give elevations, section and plan of it as a centre plate in this issue. The chapel comprises a broad nave with shallow transepts, chancel, organ chamber and vestries, and a gallery at the northern end. Flanking the entrance are two octagonal towers, with a large semi-circular window between them. The nave roof is supported on each side by five massive arches, springing from octagonal stone piers, the roof being of open construction with framed trusses in Oregon pine. On the ridge is a lead and oak shingle turret utilised as the ventilation exhaust. The walls of the chapel are of red brick, with Darley Dale stone dressings and bands.

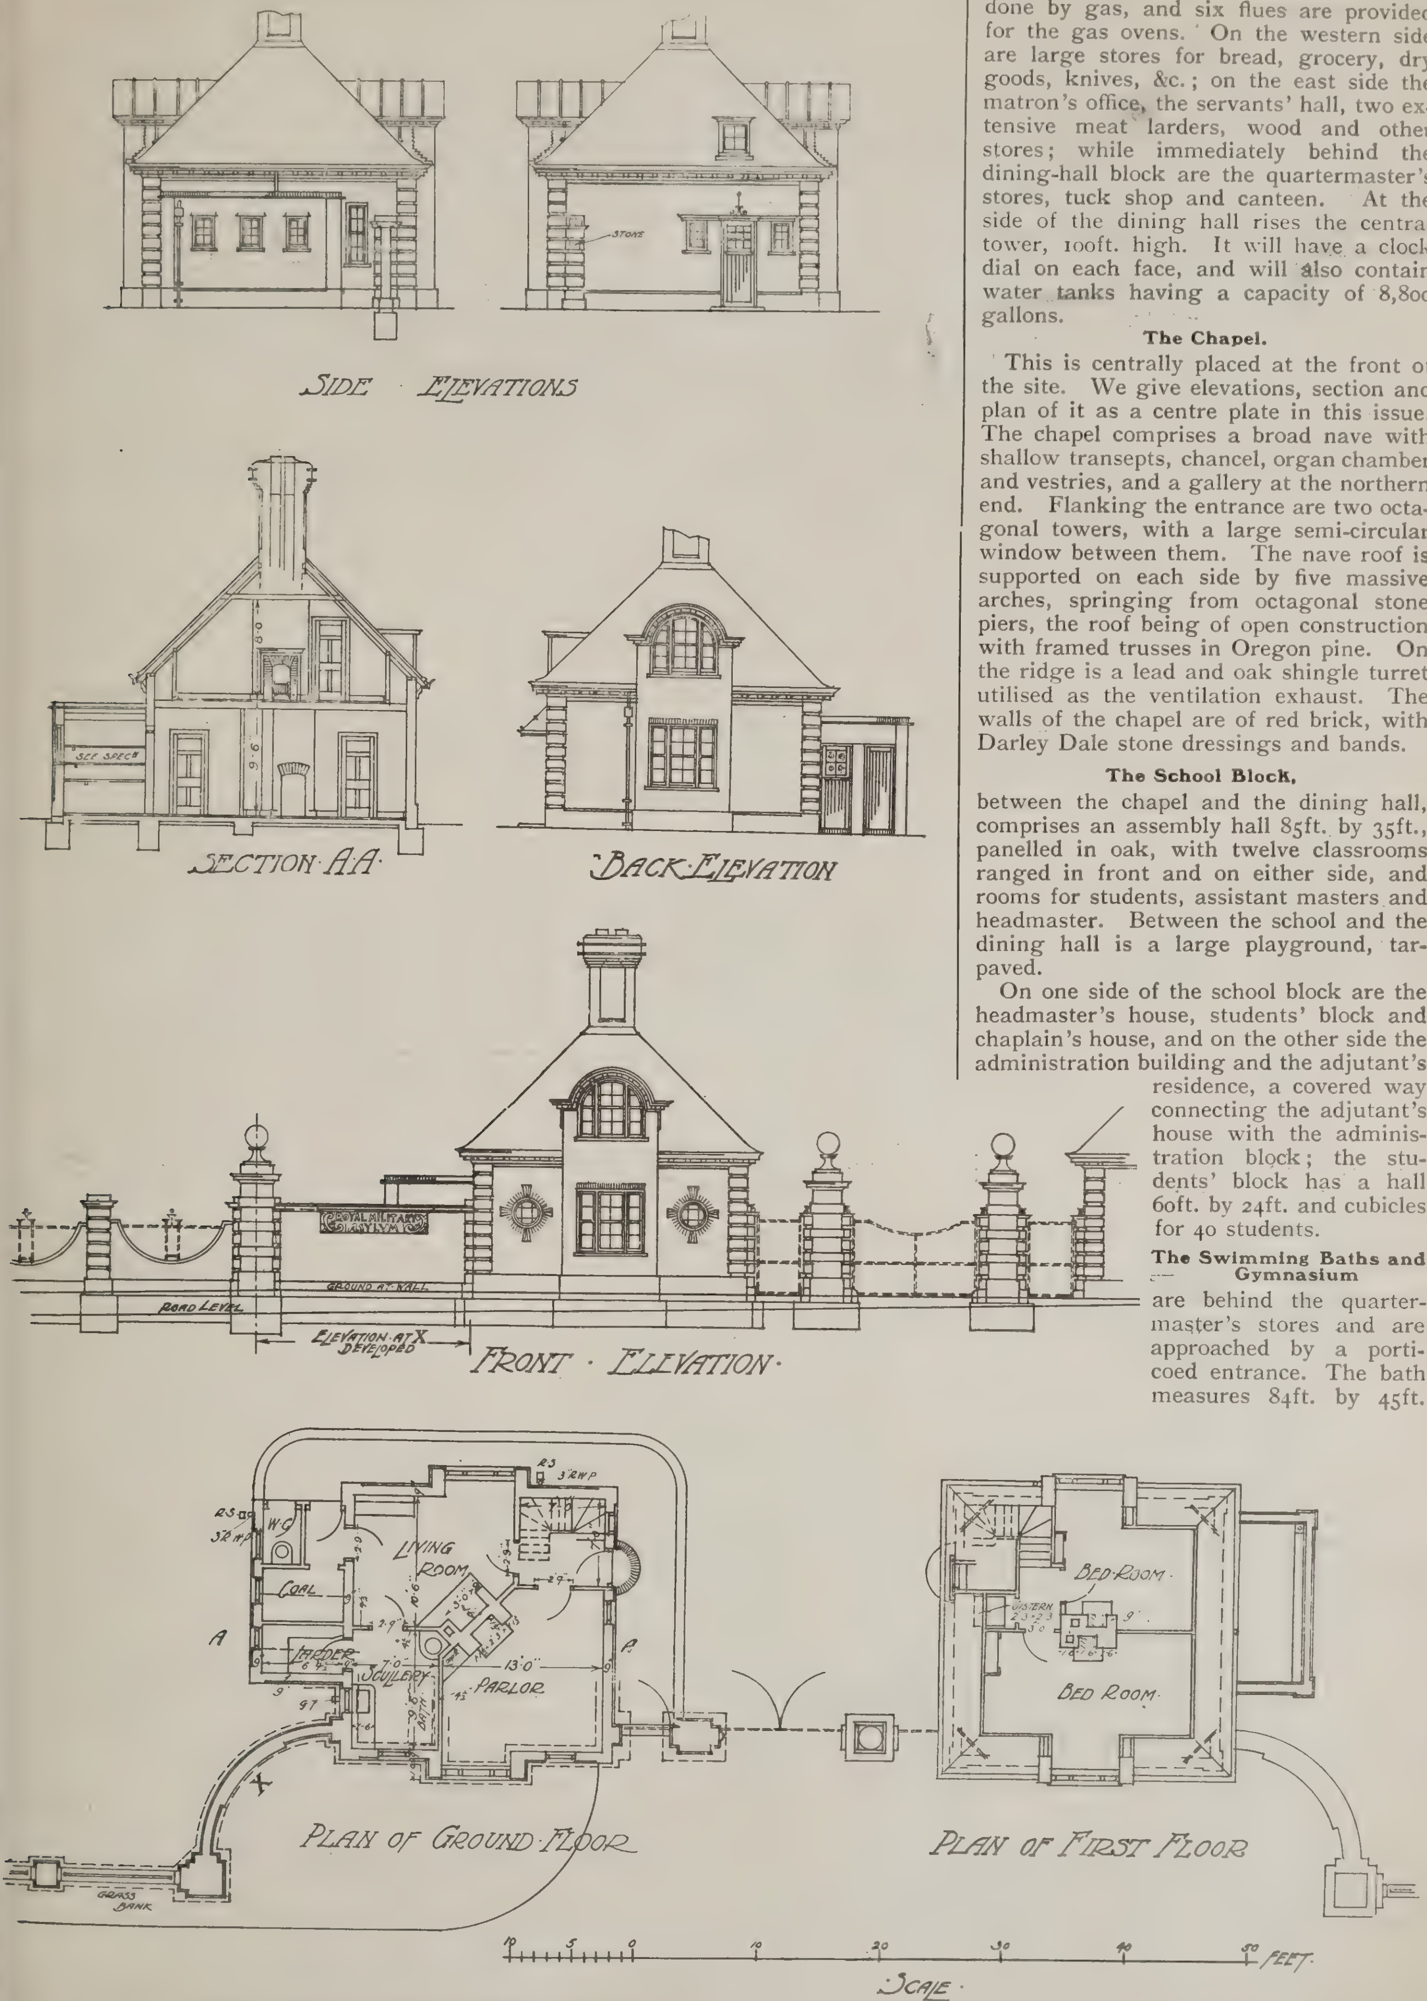
The School Block,

between the chapel and the dining hall, comprises an assembly hall 85ft. by 35ft., panelled in oak, with twelve classrooms ranged in front and on either side, and rooms for students, assistant masters and headmaster. Between the school and the dining hall is a large playground, tar-paved.

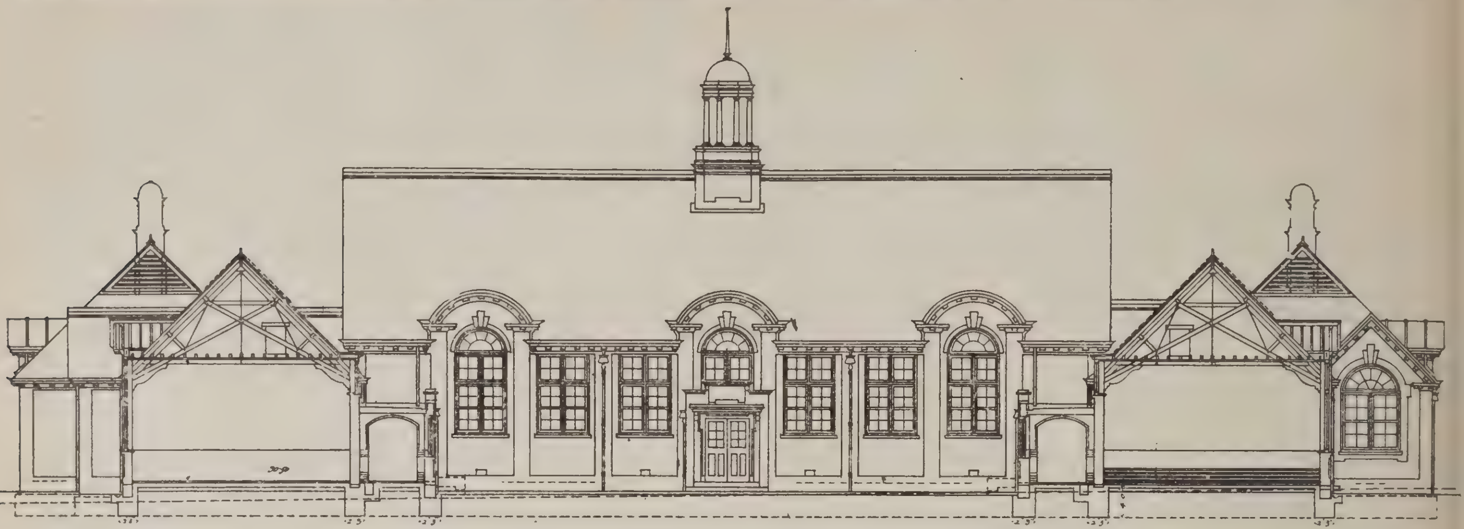
On one side of the school block are the headmaster's house, students' block and chaplain's house, and on the other side the administration building and the adjutant's residence, a covered way connecting the adjutant's house with the administration block; the students' block has a hall 60ft. by 24ft. and cubicles for 40 students.

The Swimming Baths and Gymnasium

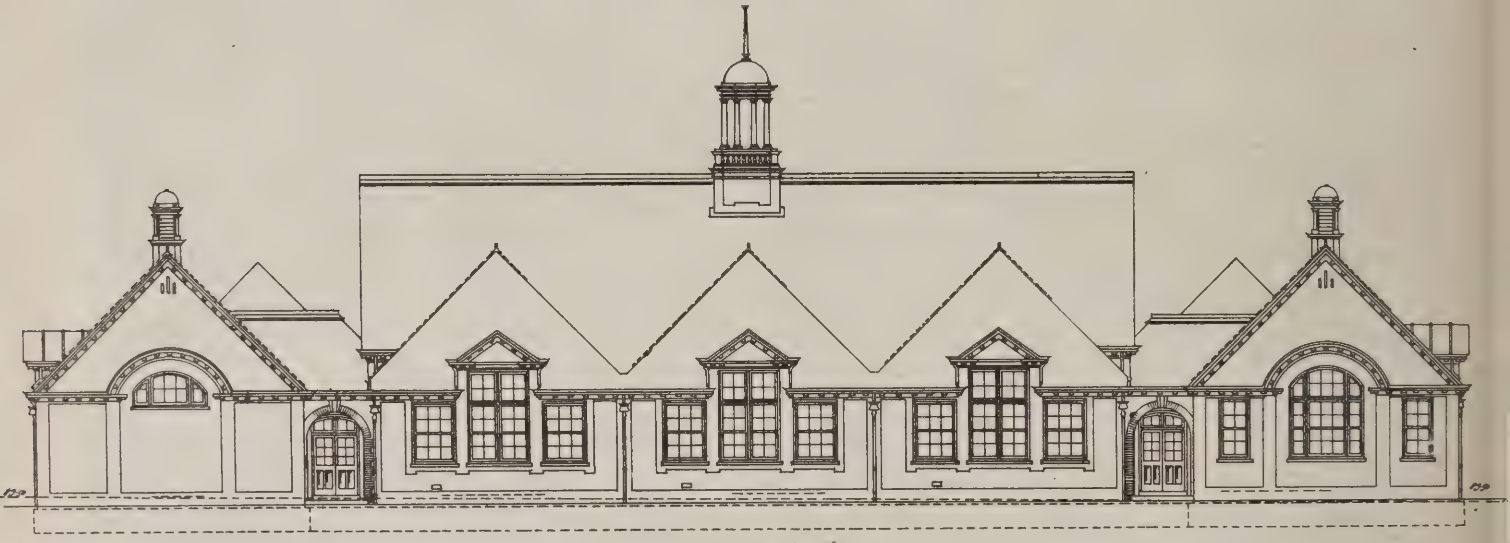
are behind the quartermaster's stores and are approached by a porticoed entrance. The bath measures 84ft. by 45ft.



DUKE OF YORK'S SCHOOL, DOVER: ENTRANCE LODGES. SIR HENRY TANNER, PRINCIPAL ARCHITECT, H.M. OFFICE OF WORKS.



North Elevation and Section.



South Elevation.

with a depth of water ranging from 3ft. to 6ft. 6ins., and will be lined with glazed bricks; a gallery runs round. The gymnasium, adjoining, is 100ft. by 45ft., with a gallery on three sides. Behind these buildings are the boiler-house, engine-room, laundry and wash-house, and on either side are workshops where the boys will be taught trades—there being shops for bootmakers and tailors.

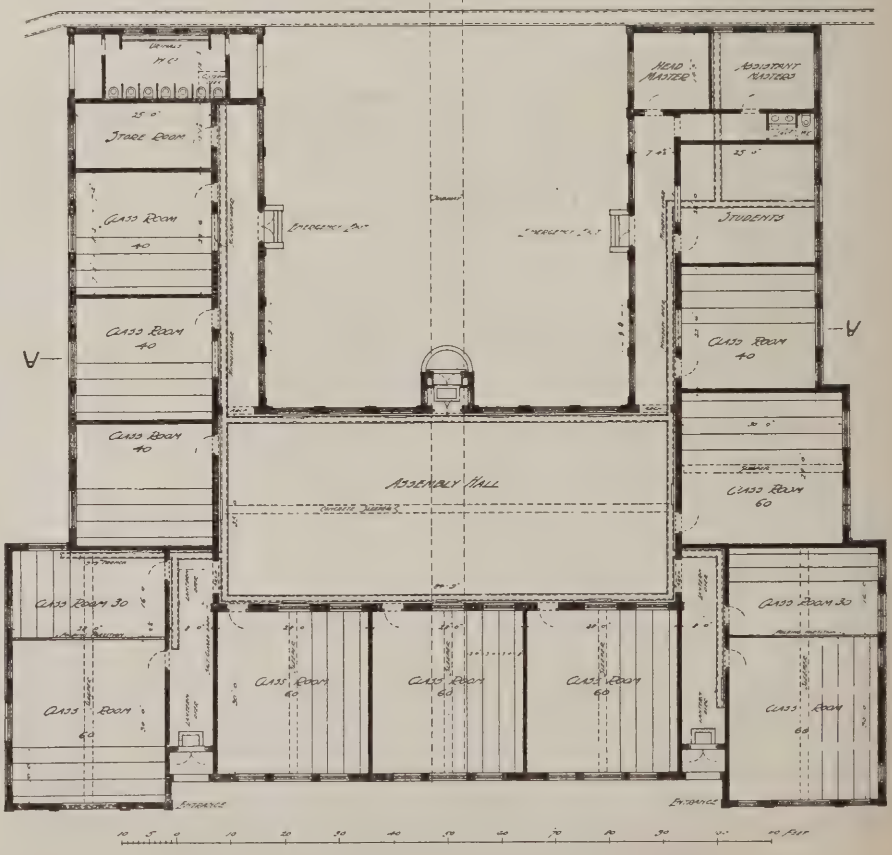
The Dormitories

are set out on a chord and are all similar. They are built right- and left-handed in the form of an H, the cross-bar being the day-room or central hall, 43ft. by 24ft., while three of the legs form dormitories, with the house for master and matron in the remaining leg.

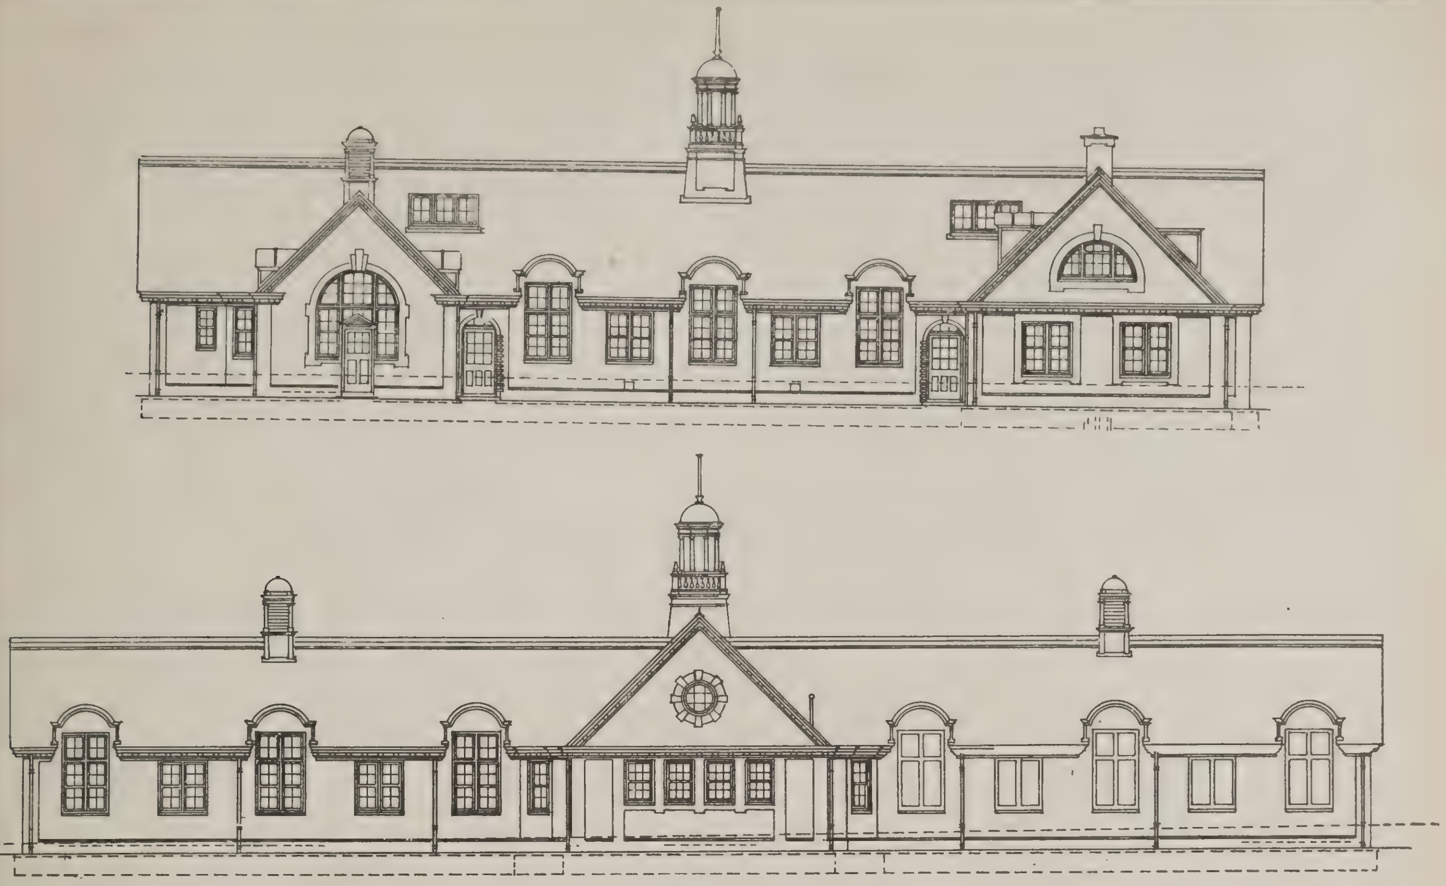
The plan is very conveniently arranged and the elevations are designed in a quiet manner, with well-proportioned windows breaking above the eaves-line—as shown by the illustrations on page 305. It will also be noticed that in the rear, between the two projecting wings, is a sanitary block, with a room also for cleaning boots &c.

The Hospital

is on the north-east portion of the site facing south. A central corridor leads to six large wards, to which are attached baths, lavatories, and other accommodation. There are also two day-rooms and a waiting hall, and doctor's, matron's and dentist's rooms, dispensing store, &c. There is also attached



DUKE OF YORK'S SCHOOL, DOVER: THE SCHOOL BLOCK.



to the hospital a kitchen, larder and scullery, entirely distinct from those in the main building. The central part of the hospital rises to a second floor, in which are nine bedrooms for the accommodation of the staff. At the rear, and detached, are a mortuary and a disinfecting room. The hospital block will be built on arches, so as to bring up the level of the floor clear of the ground.

Other buildings disposed about the site are the commandant's and medical officer's houses near the main entrance, and eight cottages near the secondary entrance.

The Playground.

Close to the school is a tar-paved playground measuring 630ft. by 430ft., with playsheds on each side 200ft. wide and 18ft. wide, and fives-courts; also a bandroom 35ft. square.

The buildings are being erected with red brick plinths and dressings, the body being filled in with rough-cast formed of small shingle, which is kept in its natural colour. This gives the elevation a warm and very pleasing effect. The roofs have all overhanging eaves, and are covered with tiles. The eaves, in most cases, have a modillioned cornice, whilst the doorways have projecting hoods supported on cut brackets having moulded fascias, and covered with lead. Internally, all the rooms where much work is carried on are faced with glazed bricks, dark brown dado or skirting, with ivory white above; the remainder being, in most cases, plastered in the ordinary manner, except the dining-room, board-room, and school-room, which are panelled with oak.

Throughout the buildings the most approved methods are being followed, there being a 6-ft. concrete subway under the blocks, in which all pipes, cables, &c., will be laid, so as to be readily inspected. Mr. Pickett is the clerk of works.

R.I.B.A.

Mr. Dibdin on Mortar.

A meeting of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the chair being occupied by Mr. T. E. Collcutt, president.

Sir William Emerson presented a portrait painted by Mr. Solomons, R.A.) of Sir Aston Webb, R.A., late president of the Institute, which was acknowledged by Mr. Collcutt.

A paper on "The Composition and Strength of Mortar" was then read by Mr. W. J. Dibdin, F.I.C., F.C.S.

The author said that the composition of ordinary lime mortar in relation to the resulting strength is in the highest degree important. The by-laws of the London County Council regarding the composition of mortar merely specify that it shall be composed of freshly-burned lime and clean sharp sand or grit without earthy matter, in the proportions of 1 of lime to 3 of sand or grit, but contain no reference to strength, leaving it to be inferred that if the composition is within the strict definition the strength must necessarily be practically constant—quite apart from the particular purpose for which the mortar is to be employed. Further, no "factor of safety" seems to have been considered; so that, whether the mortar is used for a 10-ft. wall or one of 100ft. in height, the by-laws equally apply without any precautions.

Mr. Dibdin proceeded to describe a series of experiments he had carried out on briquettes and blocks specially made for the purpose.

The results of the tensile and crushing tests showed that mortar made with the proportions of 1 volume of sand to 1 volume of lime with the sand unwashed as received had a crushing strength of 150lbs. per cub. inch. When the sand was increased to 2 volumes the strength fell to 92lbs. per inch. With 3 volumes sand it was only 52lbs., and with 4 volumes 53lbs. This experiment clearly indicated that an arbitrary limit of 3 to 1 is unsatisfactory, as it would prevent the use of the "excess" of lime, which in this case gave three times the crushing strength of that obtained when the by-law proportion of 3 to 1 was employed. In all the subsequent sets of this series the sand was used washed and graded. The illustrative diagram clearly brought out the fact that when the proportions were from 1 or 2 of sand to 1 volume of lime the strength was greater than when 3 volumes of sand were employed in all those cases in which the sand was coarser than $\frac{1}{50}$ in.; but when the grading was from $\frac{1}{50}$ in. and below, the strengths of the various makes were practically equal—namely, from 58 to 66lbs. per inch.

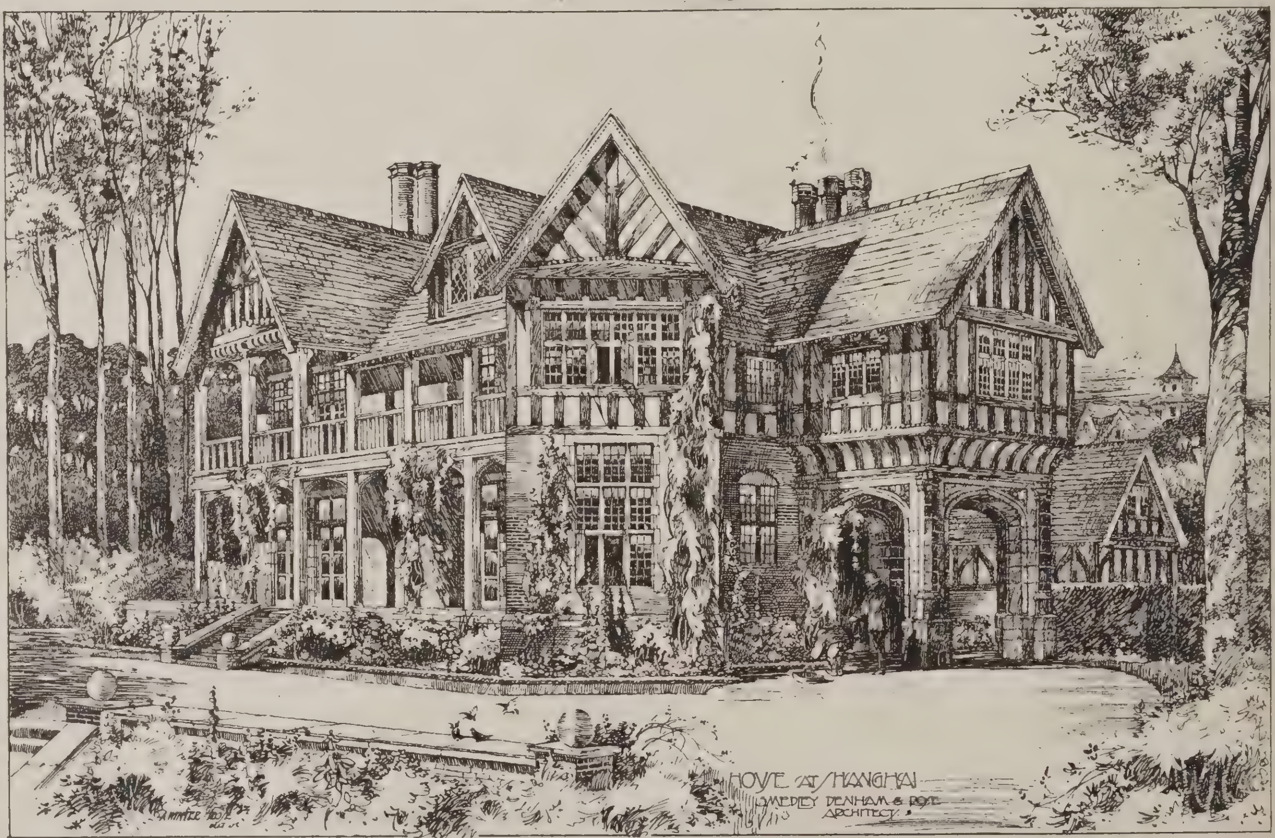
The tests for tensile strength were in the same ratio, and clearly indicated that with these particular sands an *excess* of lime in contravention of the by-laws was a distinct advantage.

The results given in a further series showed the effect of time, up to eleven days, between the moment when the mortar was mixed and that at which the briquettes and blocks were prepared. From these it would seem that up to seven days there is an increased strength, but after that time—that is to say, after the mortar had once set—the effect of a second breaking-up was distinctly detrimental, although better results were even then obtained than at any time before the first setting.

Conclusions.

Summing up in conclusion the results of a fairly exhaustive series of tests, so far as the limits of the experiments extended, Mr. Dibdin said it seemed certain that the strength of a mortar depends far more upon the physical character of the materials employed than has hitherto been fully realised. If the usual prescription of 3 to 1 be rigidly adhered to, the mortar may have in certain cases only one-third of the strength of that which might be obtained with as widely varying proportions as 5 of sand to 1 of lime; and it would appear to be desirable that the *strength* as ascertained by crushing should be the *criteria* rather than by arbitrary proportions. The tests can be made with great facility, and should be employed in all cases. Mr. Dibdin said he must not be taken to suggest that any and every admixture should be sanctioned; but where the materials are clean and sound and free from dirt (such as unwashed road sweepings, dustbin refuse, old mortar, &c.), no unreasonable objection should be taken to their use provided that they yield a mortar having strength sufficient for the work in hand.

A discussion followed, in which Messrs. Searles Wood, William Woodward, Max Clarke, Alan E. Munby, W. D. Caröe and T. E. Collcutt took part. On the motion of Mr. Max Clarke, the following resolution was passed:—"That this meeting is of opinion that the question of the composition of mortar is a matter which deserves the fullest consideration, and with that end in view, the Council be asked to vote a sum of money to aid investigation into the subject."



This house, which is executed in red local bricks, stone dressings and oak framing, is for Walter Carter, Esq., of Shanghai. The roof, which is constructed of Singapore red wood, is covered with black fibrous cement tiles imported from France. The doors and internal woodwork, where not painted, are of teak, the windows having Malava hardwood frames and cedar casements. The servants' quarters are over the stables at the rear of the building. The best aspect for houses in Shangai is the south, whence come the cool summer breezes. The back of the house is closed up as much as possible in order to protect it from the cold north winds of the winter. Messrs. Smedley, Denham and Rose, of Shanghai, are the architects.

THE ARCHITECTURAL ASSOCIATION.

Mr. Seth-Smith on the Architecture of Sicily.

A meeting of the Architectural Association was held on Friday evening last at 18, Tufton Street, Westminster, the chair being occupied by Mr. Louis Ambler, vice-president, in the absence through illness of the president. Mr. R. S. Balfour, who, however, is making good progress towards recovery.

A paper on "The Architecture of Sicily" was read by Mr. W. Howard Seth-Smith, F.R.I.B.A. Before proceeding to deal with the history and character of the architecture on the island, Mr. Seth-Smith warned the student as to accepting even the best guide-books as authorities. "In this instance let him read beforehand, and again on the spot, such works as C. A. Cummings's 'History of Architecture in Italy,' Fergusson's 'History of Architecture,' Baldwin Brown's 'From Schola to Cathedral,' Leader Scott's 'Cathedral Builders'; and consult in the Institute Library such works as Gravina's 'Il Duomo di Monreale,' Delhi, Gally-Knight, Hittorff, Mothes, Sabazaro, Dautier, &c."

For supremacy over Sicily, Phœnicians, Etruscans, Greeks, Romans, Byzantines, Saracens, Normans and Spaniards in succession had struggled, but we should be disappointed if we expected to find many monumental evidences of their occupations, for, with the exception of those of the Greek, Roman and Norman periods, scarcely any traces remained.

The classic Greek period of 500 years extended from 735 B.C. to 210 B.C., when the Romans finally conquered the island. Notwithstanding the obliteration of the vast city of Syracuse (excepting the theatre), there are important remains still standing of two fine temples at Gigenti and one at Segesta, all, however, bereft of their setting as the central or foreground objects in great and beautiful cities.

Of the great scale of some of these temples an idea could be formed when it was stated that the cast of an abacus of a capital in the Palermo Museum was 12ft. 6ins. square, and the caryatid of Jupiter in his temple at Gigenti more than 24ft. in height.

Of the Roman dominion, which lasted 600 years—namely, from 210 B.C. to about 400 A.D.—fewer still were the evidences. The Romans plundered Sicily of all its treasures of Greek art. The great theatre at Taormina is, however, mostly Roman. From Roman times until 535 A.D. the northern tribes held sway, when the island was made subject to the Byzantine emperors, who retained it till they in their turn were conquered by the Arabs. The Arabs ruled for more than 200 years, but almost the only genuine Arab monuments remaining are the Baths of Cefalà and the gate of the town of Ortigia (Syracuse). Following the Arabs came the Normans.

The Early Churches

When Roger, the first Norman king, was crowned in 1030, churches began to rise all over the island. Several of the earlier churches are modified transcripts of smaller monuments of the Eastern towns—a Greek cross in a square with central dome, sometimes repeated in the adjacent bays, and with three apses on the eastern side. The little church of La Martorana, commenced about 1129, well illustrates this type. S. Giovanni degli Eremiti, however, though of the same date, has a different plan altogether, being T-shaped, and without aisles. The custodian and most of the guide-books state that this church was originally an Arab mosque converted to Christian uses; the plan, however, is thoroughly Byzantine; the cloisters are very beautiful—arcades of pointed arches on coupled twisted columns. Another and most remarkable example of Byzantine arrangement and construction is the little chapel at Malvagna, near Randazzo—only 18ft. square, with semi-circular apses opening from three sides.

In all these instances the Normans allowed their monuments to be built in the style and with the decorations familiar to the peoples they governed. The pointed arch here first introduced to them became general, but it was the arch of the Saracens, broad, high-stilted, and without mouldings, and had no relation whatever to the use of the pointed arch of the north of Europe, which was even then beginning to be introduced in the monastic architecture of Italy. Nowhere in Sicily is there any instance dating from this period of an interior which has any hint of a Gothic system. The use of the intersecting vault is confined entirely to the small bays of the aisles or porches, while the naves where not domed or covered by the equally Oriental stalactite ceiling, are invariably covered with an open timber roof.

The Capella Palatina.

This chapel was built by King Roger in the Royal Palace and is one of the most interesting and valuable monuments of the splendid architecture of the Norman kings. In general plan it was more in harmony with the tradition of Italy. It is only in the treatment of its details, in the use of the pointed arch, and in its sumptuous decoration that we feel the influence of the mixed Orientalism which coloured all the art of Sicily at this period. The nave has a carved wood ceiling of the richest Moorish character, similar to those in Granada and Seville, and decorated lavishly with gold and colour. Even without its gorgeous colour, the lighting of this church would be fine. "In no other interior which I have seen," said Mr. Seth-Smith, "is the contrast of light and shade so fine, reminding one of the Spanish cathedrals." The glazing of the windows is quite without colour—a most important principle, as any stained glass would have confused the scheme of wall colouring.

"In this lovely chapel Norman architecture in Sicily came to its full flowering. In later monuments we find equal magnificence, but nowhere more typical or more beautiful expression of the geniuses of the place and time."

The Mosaics.

Speaking of these, Mr. Seth-Smith said that in no spot in the world could the principles and methods of the early mosaicists be more successfully studied than in Sicily. Those at Santa Sophia were largely hidden from view behind Mohammedan whitewash, or destroyed, while much at St. Mark's, Venice, had been restored out of recognition, or had given place to imitations of painter's art. The decorations of the Palerman churches represented the zenith of Byzantine mosaic art of the Second Period. Nothing finer had been done before, even at Santa Sophia, or St. Mark's, and nothing so fine followed. The Sicilian mosaics were kept sufficiently distant from the eye to prevent an unpleasant sense of the coarseness of the material and its joints, and to blend its irregular lines and surface into a rich and harmonious whole.

The method of execution employed in Sicily and elsewhere in mediæval times was as follows:—A coat of fine lime mortar was spread on the wall upon which, when fresh, the picture was broadly painted in fresco in the proper colours. The painter was immediately followed by the mosaicist with the cubes, which were embedded in the soft mortar.

In the Sicilian Norman churches the mosaics cover the entire wall surfaces, domes and vaults, and even the angles of the archivolts are all rounded off to carry on to the soffits of the arcades. The ground is nearly all of gold—not the hot yellow gold of modern mosaics, but low-toned, soft and rich, and the decorative designs are bright in tones that do not give the effect of patches of dark on a light ground. The pallete used is a very limited one, greys and grey-blues, violets, soft greens, madders, with scanty use of silver, dark reds and russets.

The size of the cubes averages nearly 1in. square for the larger surfaces, and about ⅜in. for faces, hands, &c. The medieval method of cutting up the cakes of enamel-glass with chisel-like hammers produced the great irregularity in the cubes which, with their corresponding variety of joint and surface, gives such subtle charm to old work, compared to the modern machine-cut cubes.

The Cathedral of Cefalu.

The cathedrals of Messina and Cefalu are both nearly contemporary with the Capella Palatina. Cefalu is a church of great interest, its most striking feature being the very lofty choir opening into the nave. There is nothing like it south of the Alps. The whole body of the church is white, so that the eye is led up to the choir, and once there it remains, dwelling with intense satisfaction on the glorious wealth of colour with which the chancel is enriched by mosaics.

Palmermo and Monreale Cathedrals.

An interval of nearly 50 years seems to have elapsed between the building of the churches of Messina and Cefalu and the two great cathedrals of Palermo and Monreale, the only additional examples of the splendour of the Norman church architecture in Sicily. Palermo Cathedral was doubtless one of the most beautiful in Sicily, but the 18th-century transformation has, alas! left little or nothing except the general ground plan, and not all of that, a new east end having been built within the old. Now the frigid silence of the Palladian style reigns within, simple indeed and dignified, but lifeless as the century in which it flourished.

The Cathedral of Monreale is very richly decorated on the exterior with interlacing arcades of pointed arches, the upper stages being covered with geometrical inlay of marble and asphaltum, and the walls further enriched by horizontal bands and circles of the same character. "There are few exteriors in Europe possessing a surface decoration of equal richness." It has also some magnificent bronze doors, while the interior of the cathedral has decorations of surpassing magnificence.

Of the remaining Palerman churches S. Francesco, 1302, and its contemporary St. Agostino are, as to date, Gothic churches with many Norman details. There is also the late 16th-century church of Sta. Maria della Catena.

Correspondence.

An Old Water Main.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—On demolishing in October last old Fulledge House here (an Elizabethan house), to make way for the new Council school, a pipe line of unusual character was found. Oak beams were bored from end to end and jointed at their ends by socket and spigot of a conical kind. Some of them seem to have been made from trees. They are not halved, but bored. Two of them have been taken to the museum at Towneley Hall for reference. This may perhaps interest readers. —Yours, truly,

JOHN R. LEE,
BURNLEY. Art Master.

CONTINENTAL, ROMANESQUE, AND GOTHIC DETAIL.

A lecture on this subject was delivered by Mr. G. A. T. Middleton, A.R.I.B.A., before the Northern Architectural Association at Newcastle last week. Mr. Middleton said the English forms were distinct in many respects, due to an entirely different inspiration from that which influenced Continental work. Like the English, however, the early Romanesque of the Continent had a Roman origin, but it was much more closely allied to its original. There seemed to have been two streams of influence which followed the two main trade routes into North-Western Europe; one along the Rhine, passing northwards as far as Cologne, and then spreading out like a fan across North France and Germany, and the other traversing the South of France, and gradually spreading northwards through Poitou and Beri to the Ile de France. The former stream was much more nearly allied to the Roman than was the latter. In the doorways of Mainz Cathedral, and in many other examples, they found the Corinthian capital in an exceedingly pure form, though it was often used to carry an archway arranged in orders or stages, either unmoulded or enriched with mere rolls at the angles and shallow hollows on the main faces, such as were employed in the early Norman period in England. Arches of the same character were found in the South of France, but the detail of the carving was more Byzantine in type than Roman —*i.e.*, cut down by incision below the general surface of the stone rather than with projecting leaves and volutes, and showing a less appreciation of the use of the chisel and more of the drill. In the north-west of France those two types coalesced, forming what is known as Norman, there being super-added another influence—namely that of the Scandinavian pirates, who ravaged the whole coastline. The result was the production of an architecture whose details were of a mixed character, the classic origin being often difficult to discover beneath the Scandinavian overlap of billet or chevron, representing embroidery stitches, or of grotesque animal sculpture, or of forms suggestive of twisted wirework. Towards the end of the 12th century, when the whole spirit of architecture changed, and Gothic replaced the Norman of England and the Romanesque abroad, they were accustomed to recognise a similar change in the detail, particularly in the matter of mouldings. As a fact, however, the mouldings of France and of Germany scarcely altered from their Romanesque character until the end of the 14th century. The deep undercutting of our beautiful Early English period was unknown in France, save in a few instances where the English influence was paramount. Contemporaneously with this development of a new spirit came the evolution of true Gothic mouldings, the work of the French Flamboyant period in particular being original, and as richly cut as English work of the 13th century, entirely different from the flat and lifeless "Perpendicular" mouldings to which ours had degenerated by this time.

SCULPTURE AND ARCHITECTURE.

The paper on "Sculpture in Relation to Architecture" was read before the Society of Architects last Thursday by Mr. S. Charles Kaines Smith, B.A. Cantab. At the outset Mr. Smith emphasised that the object of architectural sculpture was to beautify, not merely to be beautiful. A clumsy, ill-built and ill-proportioned building encrusted with the most exquisite sculpture was not beautiful, nor was a fine architectural achievement enhanced by ill-conceived and ill-executed sculpture. Moreover, it was of the greatest importance that the sculpture should be sympathetically disposed about the edifice. On no pretext must its presence be allowed to disguise, weaken or falsify the structural lines. The blank wall of a reservoir dam was beautiful in its impassive strength, and the least ornament would be trivial and weakening in effect unless placed at the very crest of the wall above the known water-line, but sculptured figures on the coping would be perfectly admissible, for by their very lightness they would serve to accentuate the massive power of the dam. In the same way sculpture might be employed in conjunction with bridges—the Charles bridge at Prague and the Pont Alexander III. in Paris being cited in this connection. Mr. Smith regretted the lack of co-operation which existed between sculptors and architects. He said the general impression conveyed by the sculptured figures on recent London buildings was that they had climbed out on to the tops of the windows, or on to the parapets, and continued to recline upon their giddy couches because they were unable to retrace their perilous steps. In no sense did they form an integral part of the building. Mr. Smith then went on to describe "the most complete and perfect scheme of decorative figure sculpture in the world"—namely, on the Parthenon at Athens. This consisted of the pedimental sculptures, the Doric frieze of metopes, and the Ionic frieze on the outside wall of the cella. The Doric frieze with its series of sculptures in vigorous action was succeeded by the Ionic frieze, glowing with colour and gold in the subdued light reflected from the pavement within the peristyle, leading finally to the door of the holy place, where, in the amber twilight that filtered through the thin marble tiles, was the statue of Athena in gold and jewels, particolour of enamel and cunningly-wrought metal. "It is a climax, superb and supreme, to which the sculptor has led you, insensibly, irresistibly, because the source of his inspiration, and of that of the architect, was one and the same source, because the Parthenon without its sculptures had been a mere shell, dead and meaningless, and because those sculptures, divorced from their surroundings, could lead nowhere, could serve no purpose, and tell no story of a nation's passionate devotion."

LIGHTNING CONDUCTORS.

On December 6th Mr. Alfred Hands, F.R.Met.S., delivered a lecture before the Royal Engineers at Chatham on "The Protection of Buildings from Lightning." Mr. Hands showed the extent of damage done by lightning by means of a chart of England and Wales, on which the positions and nature of objects damaged, during a period of about nine years, were indicated by coloured spots. This included 2,485 buildings, of which 148 were churches. He criticised the report of the Lightning Research Committee, which, he said, by its contradictory recommendations and incorrect statistics, had caused a great deal of scepticism as to the utility of lightning conductors. He then showed by diagrams, and by reproductions on models of buildings of cases that had occurred, some of the more complex lightning effects that had to be guarded against and the methods of protection that had to be employed. These included fires caused by the surging effect of a discharge, and cases in which damage is caused to a building by lightning striking an object half a mile away. Mr. Hands laid stress on the impossibility of protecting buildings efficiently by means of set rules. Each case had to be studied separately and that system of protection applied which the complications of metal in and about the structure showed to be necessary.

Mode of Application All-Important.

Hitherto, said Mr. Hands, too much importance had been attached to the form and composition of the conductor, and too little to the fact that its efficiency depended almost entirely on the way in which it was applied, and very little on what it was. He regarded the subject as somewhat analogous to the work of a medical practitioner. The conductors in the hands of an expert were comparable to the drugs a physician might find it necessary to prescribe according to his diagnosis of the case. We were not infallible, and anyone might overlook some factor that might have an important bearing on the case, but the fact remained that the possession of knowledge, experience and an ability to discriminate as to the importance of details should enable a man to protect a building effectively, while absence of these would very probably result in failure.

Relative Value of Iron and Copper.

As regards the relative value of iron and copper for conductors, he considered the matter, so far as concerned conductivity and the dissipation of energy, to be of such trifling practical importance that it sank into insignificance in comparison with considerations of durability, and iron was unfortunately too perishable for the purpose; while, as regards cost, an iron system, if of sufficient size to be fairly lasting, would be dearer than an ordinary copper tape one.

Mr. Hands said that vagaries or freaks of lightning were an impossibility, and the belief in such was due only to the cases being wrongly reported.

Notes on Competitions

Conditions for the New County Hall.

The conditions of the competition for the new County Hall have now been drawn up by the Establishment Committee and put before the Council. It will be recollected that the competition is to be in two stages, a preliminary and a final, there being two assessors in the former (Mr. Norman Shaw and Mr. W. E. Riley, the Council's architect), and three assessors in the latter—Mr. Shaw, Mr. Riley, and a third assessor selected by the competitors in the final competition. Mr. Shaw and the assessor nominated by the competing architects in the final competition will each receive an honorarium of 1,000 guineas, and the competitors in the final competition will receive 200 guineas each. The cost of the building is put at £850,000. The Establishment Committee recommend that the following eight architects be invited to submit designs in the final competition:—Mr. John Belcher, Mr. William Flockhart, Mr. Ernest George, Mr. Henry T. Hare, Mr. T. G. Jackson, Mr. E. L. Lutyens, Mr. E. W. Mountford and Messrs. Nicholson and Corlette. The successful architect will be assigned the work of carrying out the design in conjunction with the Council's architect, the successful architect receiving nine-tenths of the usual commission of 5 per cent. and the Council's architect receiving the remaining one-tenth. The date for sending in designs for the preliminary competition is recommended to be May 7th next, and for the final competition October 3rd next. In the preliminary competition the assessors will select in private not fewer than 10 nor more than 15 designs, and the authors of these will compete with the 8 selected architects in the final competition. Mr. Riley is to have discretionary power in all matters relating to internal economy, building construction and stability.

Clause 13 of the conditions states that "Should the building from any cause not be erected within a reasonable time after the two competitions shall have been held the author of the selected design will be paid at the rate of one-fifth of the commission to be given for his services, the basis being his estimate of the whole cost, such amount to form part of the commission if the building is erected from his design."

The drawings submitted in the preliminary stage will be returned under seal to their respective authors after the award, and successful competitors in the preliminary stage can, if they wish, amend or re-draw their designs for the final stage. Four months—from May to October—are allowed for this. An embankment is to be formed on the site, and competitors will be desired to include in their scheme a design for the superstructure of this embankment wall, which is to be of granite.

Clause 30 of the conditions states that the greatest importance will be attached to simple and convenient planning, and it is essential that all parts of the building should be amply lighted.

Drawings in the preliminary stage are to be one-sixteenth scale, the drawings required being plans of each floor, elevations of the three principal façades, and sections. *No perspective drawings are to be submitted in either stage.* For the final stage additional drawings required will be sections through council chamber and main staircase to one-eighth scale and a detail of a portion of one of the façades. Plans are to be drawn on paper 52ins. by 30ins. and mounted on stainers, and no washes, shading or hatched shadows for the purposes of embellishment will be permitted on elevations, other than flat washes in the openings. When the Council has confirmed these conditions they will be issued to architects.

A 3 Per Cent. Offer.

A Liverpool correspondent sends us the following particulars of a competition for the George Edwards' Memorial Hall, Cefn, Ruabon:—"The neighbourhood is industrial, having a population of 7,000. What is desired is a building to meet the social requirements of the neighbourhood. It is desirable to have a building the holding capacity of which is as great as possible, and one which can also be made suitable for smaller gatherings, such as committees, dinner and dance parties, and billiard-room; this dual function might be carried out by having one spacious hall and 2 or 3 ante-rooms, or a large hall convertible into rooms of a smaller capacity. The committee suggest 800 as the seating accommodation. The total expenditure not to exceed £1,300, inclusive of fees. The outside walls to be faced with seconds red facing bricks. Carnarvon slates to be used. Commission to be offered at 3 per cent for the supply of plans, specifications, details and general supervision. The site is a level piece of ground, having a retaining wall 9ft. high at the back. Entrance from Well Street only. Passage for side entrance next to cottages. Designs to be in by January 12th, 1907. W. R. Jones, Secretary, High Street, Cefn, Ruabon."

List of Competitions Open.

Deposit for conditions given where known.

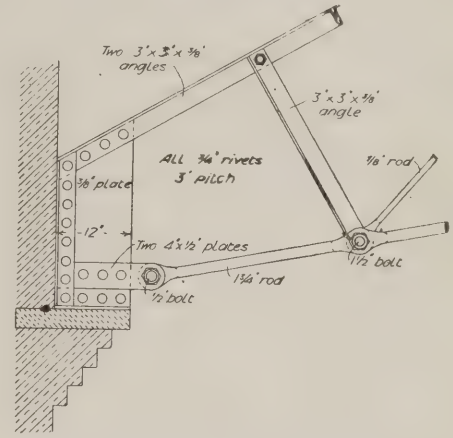
DATE OF DELIVERY	COMPETITION.
Dec. 31	LABOURERS' COTTAGES AT DUBLIN.—Premiums of £50, £30 and £20. Particulars from A. R. Barlas, secretary, L.G.B. Offices, Dublin. No deposit.
Dec. 31	DUAL SECONDARY SCHOOL AT GOOLE.—Premiums £50 and £25. Particulars from James W. Johnson, clerk to Governors, Council Offices, Goole. Deposit £2 2s.
Dec. 31	NURSES' HOME AT GENERAL HOSPITAL, WOLVERHAMPTON.—Particulars from J. Stephen Neil, House Governor and Secretary, General Hospital, Wolverhampton. No deposit.
Dec. 31	BATHS AT ASHTON-IN-MAKERFIELD.—Limited to architects in Wigan and Leigh Poor Law Unions. Particulars from A. Sykes, clerk, Council Offices, Ashton-in-Makerfield. No deposit.
1907 Jan. 5	SECONDARY SCHOOL AT GUISELEY, LEEDS (for 200 scholars).—Name by this date to M. Rennard, secretary to Governers, Guiseley, Leeds.
Jan. 12	LAY-OUT OF RIDDRIE ESTATE, GLASGOW.—Premiums of £75, £50 and £25. Particulars from A. W. Myles, town clerk, City Chambers, Glasgow. No deposit.
Jan. 19	LIBRARY AT PLYMOUTH.—Premiums £50, £30 and £20. MUSEUM AND ART GALLERY AT PLYMOUTH. Premiums £25, £20 and £10. Limited to local architects. Particulars from Borough Librarian, Plymouth.
Feb. 1	CHILDREN'S HOSPITAL AT SUNDERLAND.—Premiums of £100, £50 and £25. Particulars from T. Robinson, secretary, Infirmary Offices, Bank Buildings, Sunderland. Deposit £1 1s.
Feb. 16	CONGREGATIONAL CHURCH, SCHOOL AND MANSE, GRIMSBY.—To cost £8,200. Premiums of 25, 15 and 10 guineas. Particulars from E. L. Bridge, Fish Docks, Grimsby. Deposit £2 2s.

Enquiries Answered.

Boiler-House Roof.

COVENTRY.—PLANT writes: "It is proposed to extend a boiler-house, the existing iron principals to which are fixed at 12-ft. centres. In the proposed extension the chimney stack is partly included, and necessitates the principals being placed 16ft. apart to clear the chimney. Would it be better to continue the principals at 12-ft. centres, as at present, and erect the principal against the chimney stack on a stanchion, or to carry out as suggested by sketch? Also, are there any special measures to be taken in building a wall up to a chimney stack? The stack is 180ft. high."

It will be better to continue the trusses in the same style at the same centre distances, and to shorten the ends of the one opposite chimney shaft, carrying it on a stanchion or upon corbelling from the shaft. The shortened end will be as shown by the illustration below. The wall on each side of the chimney shaft should meet it with a straight joint to avoid any cutting into it that can be avoided, but the walls may be stiffened at the abutting ends by the formation of a pier on the outside.



HENRY ADAMS.

Liability for Drain.

Z. Z. writes: "About 20 years ago we laid the drains to a row of cottages. As the public sewer was not laid in this street at the time the local board allowed us to lay a drain on the owner's ground and connect same to a local board sewer in the next road, and at that time they passed them as sound and satisfactory. Some short time ago the present council condemned these drains and instructed us to relay new drains and connect them to their sewer. Are we liable for this?"

If the facts are correctly stated, the Authority cannot recover payment. If the contention is that the drains were insanitary the Authority can, on the facts being proved, cause such drains to be relaid, but only to the sewer into which they previously discharged. They cannot compel an owner to pay for making connections to a new sewer. See *St. Martin's Vestry v. Ward*, Court of Appeal, November 14th, 1896. In this case both the old drain and the old sewer (at rear of premises) were admittedly defective. The vestry constructed a new sewer in front of premises and gave notice to defendant to drain into it. The defendant refusing, the vestry entered, did the work, and sued for payment. The case was dismissed, both in the lower Court and the Court of Appeal.

Notes and News

Society of Engineers.— Mr. Richard St. George Moore has been elected president of this Society for 1907.

New Parish Council Chambers at Hamilton have been erected at a cost of £3,300. Mr. Alexander Cullen was the architect.

A new Theatre at Cardiff has been erected from designs by Messrs. Runtz and Ford, of London. It was opened by Mr. Beerbohm Tree last week.

At the recent Milan Exhibition Messrs. L. and C. Hardtmuth were awarded the Grand Prix both for their celebrated pencils and for "Waterman's Ideal Fountain Pens."

Correction. — In the pass list for the R.I.B.A. examinations on p. 299 of our issue for last week the name of Mr. F. Waldron in the list of probationers was incorrectly given as "Waldrow."

Prof. W. R. Lethaby has been appointed surveyor of the fabric of Westminster Abbey, in succession to the late Mr. J. T. Micklethwaite, and Mr. Arthur G. Wallace has been appointed assistant surveyor.

The new King's Theatre, Edinburgh, was opened last week. It is in Leven Street, and has been erected from designs by Messrs. James Davidson, F.R.I.B.A., of Coatbridge, and Mr. J. D. Swanston, of Kirkcaldy, joint architects. The cost of the building has been £50,000.

New City Police Buildings.— The Police Committee of the Corporation has approved of a scheme for erecting blocks of buildings in Bishopsgate for the accommodation of married officers and constables of the City police force at a cost of over £16,000. Provision will also be made for an ambulance station in connection with the new electric ambulance system, which the Corporation has adopted.

St. Paul's.— At last week's meeting of the Court of Common Council the Lord Mayor read a statement by Mr. Mervyn Macartney, surveyor of St. Paul's Cathedral, to the effect that no serious subsidence had taken place in the south wall, and that the Dean and Chapter, acting on the advice of their engineer, had given permission to the County Council to construct the proposed deep-level sewer beneath St. Paul's Churchyard.

Model Cottage Exhibitions.— In addition to the model cottage exhibition to be held next year at Walker, Newcastle-on-Tyne (see p. 300 of our issue for last week), a similar exhibition is to be held at Firth Park, Sheffield. Particulars can be obtained from Mr. Henry R. Aldridge, 45, Bank Street, Sheffield.—On an estate of about 400 acres outside Wolverhampton, belonging to Sir Richard H. Paget, a model village is purposed to be established. A development plan has been prepared by Messrs. Detmar Blow and Billerey.

Messrs. Mellowes & Co., Ltd., of Corporation Street, Sheffield, have recently secured the order for glazing on their "Eclipse" patent imperishable system the roofs of extensions to works for Messrs. Hy. Bessemer & Co., Ltd., Cammell, Laird & Co., Ltd., and Samuel Fox & Co., Ltd., at Sheffield; The Staveley Coal and Iron Co., Ltd., near Chesterfield; Greenwood and Batley, Ltd., Leeds; Clark & Co., Ltd., Anchor Mills, Paisley; and lights over the art gallery at Preston.

The Honor Oak Reservoirs, in course of construction for the Metropolitan Water Board were visited on December 8th by the Junior Institution of Engineers. The reservoirs will contain nearly 60,000,000 gallons of water, and will probably be the largest covered reservoirs in the world. The construction generally is of brickwork and concrete, with walls separating the reservoir into four divisions. A middle wall 3ft. thick extends all round the outer walls, and is keyed into the clay. At the centre of the four reservoirs will be the well from which the charging and emptying will be directed. The bricks used have all been made from the excavated clay on the site; 16,000,000 bricks so far having been produced.

The new Stock Exchange at Manchester was formally opened on Wednesday last. The building is in Pall Mall, the exchange hall being at the rear, with main entrance in Norforlk Street. The "House," entrance hall, staircase, &c., are lined with marble, and over the "House," springing from marble columns at the angles, is a large dome, coffered and partly glazed. The internal wood finishings are of mahogany, teak and oak. The secretary's department is arranged in a suite of rooms on the first floor. In addition to the premises set apart for the Stock Exchange, accommodation has been provided for the Union Bank of Manchester as well as numerous suites of offices. The general contractors for the building were Messrs. William Brown & Sons, of Salford, the architects being Messrs. Bradshaw & Gass, of Bolton and London.

A Government Architect for Asylums.— In giving evidence recently before the Royal Commission on the Care of the Feeble-Minded, Mr. Alderman Crowther, chairman of the Asylums Committee for the West Riding of Yorkshire, suggested that new buildings, additions, and alterations to the asylums should be dealt with by a practical Government architect, who should devote the whole of his time to the work, and should be open to be consulted at all times direct, and not through the Lunacy Commissioners. Mr. J. Vickers-Edwards, county architect to the West Riding of Yorkshire, urged the necessity for the establishment of an Architectural Department for Lunacy Building. The principal of it should not be allowed to engage in private practice, and the department should become a separate Governmental Department in the same manner as the Board of Education or the Prisons Department.

Leeds and Yorkshire Architectural Society.—A paper on "Stained Glass" was read before this Society on December 6th by Mr. C. B. Howdill. After referring in detail to the manufacture of glass, both stained and enamelled, and the process of making ecclesiastical figure windows, Mr. Howdill said it was John Thornton, of Coventry, the glass painter of the 15th century, who glazed the great east window of York Minster, and was paid about £900 for a window which, according to modern values, would cost about £2,000. The old craftsmen of the 14th century, however, drove a harder bargain and secured better pay for their work. In the 14th century the rate of pay was 9s. (modern money) per ft. for plain glass and 18s. per ft. for coloured glass. That this was exceedingly good pay is shown by the fact that the cost of such work today would be roughly estimated at from 25s. to 30s. per ft. Some examples of the famous Fairford windows were exhibited by the lecturer, and various phases of modern glass were illustrated, including some by Burne-Jones at Christ Church, Oxford.

The Largest Contract for Spiral Staircases Ever Placed.— The St. Pancras Ironwork Co., Ltd., have carried out for the Underground Electric Railways Co. of London, Ltd., the contract for spiral staircases which have been fixed at all the stations on the Baker Street and Waterloo "tube," the Great Northern, Piccadilly and Brompton "tube," and the Charing Cross, Euston and Hampstead "tube." There are upwards of 40 stations. The staircases are about 18ft. in diameter and vary from 50ft. to 200ft. in height, according to the position of the stations. Treads and landings are covered with a new and improved non-slipping material. The staircases are built entirely of steel, and were specially designed by the St. Pancras Ironwork Co., Ltd., for the railway company. The design involves an entirely new principle in staircase construction, combining great strength with lightness and economy of material, while being of very neat appearance. Besides the staircases, the St. Pancras Ironwork Co., Ltd., have done a large quantity of work for the engineer, in the way of iron doors, steel flooring, &c., and for the architect, Mr. Leslie Green, iron casements, in the way of lights, and doors at many of the stations on all three lines.

SANITARY CONSIDERATIONS IN BUILDING.

A lecture on this subject was delivered before the Edinburgh Architectural Association last week by Mr. James L. Lawrence. He said that one most insanitary piece of construction brought about by the huge blocks of buildings was the inner court or smaller well. The only good point about it, and even this was doubtful, was that they could open their window at any time in the year without fear of a draught. But instead of pure air, they might get a smell of their neighbour's dinner or a concentrated knowledge of the ash bucket in the court below. This, with practically no sunlight and too often the need of artificial light from about November till March, made one hope that planning of this nature would not be long perpetuated. Servants' bedrooms also called for more consideration. How often we saw on a plan an odd, badly-lit room without a fire-place, conveniently designated "boxroom"; a room which was often made to serve the purpose of housing the unlucky servant. People nowadays were not blessed with quite so many boxes as the architect would sometimes make out from the space he allotted to them. Of course, if a fire could not be arranged for, it might also be difficult to put in what the law demanded—a ventilation flue or one that would really do its work; but, if possible, this should be provided, because, after all, how many people did have fires in their bedrooms except in cases of illness? The kitchen was to a great extent a dwelling-room, and special provision in ventilation should be introduced for the comfort of its inmates. No doubt the badly-cooked dinners one sometimes read about were partly occasioned through indisposition of the cook, caused by bad kitchen ventilation.

Do not scour the dirt off your Bath Tub. Just wipe it off with PORCELA. Sold by Standard Sanitary Manufacturing Co., 22, Holborn Viaduct, E.C. 6d. per ½-lb. package.

New London Buildings

At yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:

Formation of certain new streets on a site abutting upon the south-western side of Rosendale Road, Herne Hill. (*Amendment of resolution.*)

Retention of a building at the rear of "Selborne," Leigham Court Road, Wandsworth, on the application of W. Lawrance, on behalf of J. Hill. (*Consent.*)

Buildings on the site of Nos. 321 and 323, Oxford Street, to abut also upon Dering Street, on the application of Gordon & Gunton, on behalf of Hitchings, Ltd. (*Consent.*)

One-storey addition to the Battersea Polytechnic, on the southern side of Lurline Gardens, Battersea, on the application of J. Harwood, on behalf of the governing body of the Battersea Polytechnic. (*Consent.*)

Vestry addition in front of the church of St. Augustine, on the south side of Lynton Road, Bermondsey, on the application of Hesketh & Stokes, on behalf of the Rev. A. E. Lait. (*Consent.*)

One-storey addition at the flank of No. 296, Queen's Road, Deptford, to abut upon Erlanger Road, on the application of A. D. Johnson, on behalf of M. H. Glover. (*Consent.*)

Public convenience on the eastern side of Amersham Road, New Cross, southward of the "Amersham Arms" public-house, on the application of T. Corfield, on behalf of the Deptford Metropolitan Borough Council. (*Consent.*)

Retention of a one-storey addition at the rear of "The Rosemary Branch" public-house, Lewisham High Road, Deptford, abutting upon St. Donatt's Road, on the application of F. J. Eedle & Meyers, on behalf of D. J. Jones. (*Consent.*)

Addition to an office building on the eastern side of Seagrave Road, Fulham, opposite the entrance to Merrington Road, on the application of A. Whitelaw, on behalf of the London and North-Western Railway Co. (*Consent.*)

Retention of a conservatory at the rear of No. 16, Stannard Road, Hackney, abutting upon Ritson Road, on the application of G. Withey. (Consent.)

Projecting shelter in front of the Earl's Court Station of the Metropolitan District Railway Co., Earl's Court Road, Kensington, on the application of C. H. King, on behalf of the Metropolitan District Railway Co. (*Consent.*)

One-storey addition to No. 107, Ringstead Road, Catford, to abut also upon Laleham Road, on the application of H. H. Castle & Co. (*Consent.*)

House on the northern side and two houses on the southern side of Bargery Road, and two houses on the northern side of Inchmery Road, Catford, with the flanks of three of such houses abutting on the western side of Penerley Road, on the further application of Norfolk & Prior, on behalf of J. Watt. (*Consent.*)

Building on a site between Nos. 11 and 13, Portland Place, St. Marylebone, extension of period. (*Consent.*)

Oriel window in front of No. 24, Upper Brook Street, St. George, Hanover Square, on the application of R. S. Wornum, on behalf of S. E. Kennedy. (*Consent.*)

Four electric arc lamps and a projecting sign in front of the London Pavilion Music Hall, Piccadilly Circus, on the application of Wylson & Long, on behalf of the directors of the London Pavilion, Ltd. (*Consent.*)

Projecting fascia in front of a shop on the northern side of Shaftesbury Avenue, Strand, between Rupert Street and Wardour Street, on the application of W. G. R. Sprague, on behalf of J. Jacobus. (*Consent.*)

Two illuminated signs over the public way of Carting Lane, Strand, on the application of Collcutt & Hamp. (*Consent.*)

Porches to seventeen houses on the south-eastern side of Deerhurst Road, Streatham Common North, Wandsworth, southward of Hill House Road, on the application of Cole and Wooding. (*Consent.*)

Retention of a projecting clock in front of Ruskin House, Rochester Row, Westminster, on the application of A. Keen, on behalf of W. Morris & Co. (*Consent.*)

Buildings on the site of Nos. 308 and 310, Uxbridge Road, Hammersmith, to abut also upon Arminger Road, on the application of W. F. Hurndall. (*Refusal.*)

Conservatory addition over the projecting porch in front of No. 13, Hyde Park Gardens, Paddington, on the application of J. Gray, on behalf of J. K. Greig. (*Refusal.*)

Three houses on the southern side of Kensington Place, Kensington, with a forecourt boundary wall in front of such houses, on the application of H. F. Rutter, on behalf of the Metropolitan Water Board. (*Consent.*)

Building on the south-eastern side of a proposed street to lead from Burton Street to Mabledon Place, St. Pancras, on the application of Joseph and Smithem, on behalf of the St. Pancras Metropolitan Borough Council. (*Consent.*)

Erection of Devas Institute on the N.W. side of Thessaly Square, Battersea, to a greater height than the width of Thessaly Square, on the application of H. Howard Batten, on behalf of the trustees of the London Parochial Charities. (*Consent.*)

Retention of a wood and iron structure upon part of the forecourt of No. 19, Filey Avenue, Upper Clapton. (*Consent.*)

Three "cathead" cranes at the premises of Waring & Gillow, Ltd., Castle Street, East Marylebone, on the application of R. F. Atkinson, on behalf of Waring & Gillow, Ltd. (*Consent.*)

Construction and retention of an iron shed on the southern side of Down Place, Hammersmith, on the application of A. Dawkins, on behalf of the London and Westminster Motor Omnibus Co. (*Consent.*)

Building on the south-western side of Draycott Avenue, Chelsea, with a one-storey portion on the space at the rear exceeding 16ft. in height, on the application of Bourchier, Burmester & Galsworthy, on behalf of Miss Cowper Coles. (*Consent.*)

Retention of an addition upon a portion of the space at the rear of No. 18, Handel Street, Bloomsbury, on the application of Johnson & Co. (*Consent.*)

Three dwelling-houses upon a site on the western side of Basil Street, Chelsea, southward of Washington Mansions, with irregular open spaces at the rear, on the application of A. Mitchell, on behalf of Holland & Hannen. (*Refusal.*)

Building on the eastern side of Middlesex Street, Whitechapel, to abut also upon the southern side of Strype Street, and to exceed in height the width of Strype Street, on the application of C. B. Hollish, on behalf of C. and H. Finegold. (*Consent.*)

Re-erection of No. 3a, Hamilton Mews, St. George, Hanover Square, on the application of W. H. Romaine-Walker & Besant, on behalf of B. Lewis. (*Consent.*)

Building on the site of Nos. 132 to 135, Long Acre, to exceed in extent 250,000 cubic ft., on the application of W. Woodward, on behalf of Slatter & Son and W. H. Eastgate. (*Refusal.*)

Formation or laying out of a new street for foot traffic only, to lead from Woodfield Road to Harrow Road, Paddington, and proposed theatre building abutting upon the southern side of Harrow Road and the western side of the said proposed street, on the application of B. Crewe, on behalf of the Paddington Empire, Ltd. (*Consent.*)

Formation of a new street for carriage traffic to lead from Burton Street to Mabledon Place, Euston Road, St. Pancras, on the application of Joseph and Smithem, on behalf of the St. Pancras Metropolitan Borough Council. (*Consent.*)

Coming Events.

Thursday, December 20.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.—Mr. Mouchel on "Reinforced Concrete," at 6 p.m.

CHEMICAL SOCIETY.—Meeting at Burlington House, at 8.30 p.m.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

...**Dec. 20. London, S.W.**—*Erection of 40 "B" type* married soldiers' quarters, Artillery Place, Woolwich, in the Woolwich District. The plans, specification and conditions of contract may be inspected at the office of H. B. Measures, F.R.I.B.A., Director of Barrack Construction, War Office, Atterburn Street, Grosvenor Road, S.W., up to Dec. 20, and bills of quantities and form of tender obtained on the payment of 10s. (not returnable).

Dec. 20. Kilmarnock.—*Demolition of the old buildings* on the site, and for the concrete foundations, of a new post office at Kilmarnock. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to R. Scott & Son, 115, Wellington Street, Glasgow. Bills of quantities and forms of tender may be obtained from W. T. Oldrieve, H.M. Office of Works, Edinburgh, on payment of £1 1s. Tenders must be delivered before Dec. 20, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed "Tender for Foundations, &c., Post Office, Kilmarnock."

Dec. 21. Belfast.—*Providing and erecting additional fencing* at Carmoney New Burial Ground, in accordance with plan and specification, which may be seen of J. W. Robb, clerk to Belfast Burial District Council, Clerk's Office, Union Workhouse. Sealed tenders to be lodged with him not later that 12 noon on Dec 21.

Dec. 21. Maesteg.—*Re-roofing, re-seating*, and various other works and alterations to Carmel Chapel, Maesteg, for the Trustees. Plans and specifications may be seen at the office of E. W. Burnett, M.S.A., architect, St. Michael's Road, Maesteg, from whom bills of quantities may be obtained upon payment of £1 1s. Sealed tenders, on form which will be supplied, to be sent to the Secretary, J. Jenkins, 13, Bank Street, Maesteg, on or before Dec. 21, and endorsed "Chapel Alterations."

Dec. 22. Oxford.—*Additions to Oxford Diocesan Training College* for Schoolmistresses. Builders desirous of tendering are requested to send their names on or before Dec. 22 to S. S. Stallwood, F.S.A., architect, 27, Market Place, Reading, who will provide bills of quantities, and give all necessary particulars. Plans may be seen either at Polstead House, 23, Banbury-road, Oxford, or at the architect's office in Reading.

Dec. 22. Lichfield.—*Erection of new wards* for the infirm and for children at the Union Workhouse, Lichfield, in accordance with plans prepared by R. J. Barnes, architect, City Chambers, Lichfield. Contractors desirous of tendering are requested to send in their names to Mr. Barnes not later than Dec. 22, together with a sum of £2 2s. Quantities will be forwarded as soon after that date as possible. Plans may be seen at the offices of the architect.

Dec. 22. Callington.—*Erection of a new secondary school* at Callington, for the Cornwall Education Committee, according to plans and specifications which may be seen at the office of J. Sansom, architect to the Committee, Liskeard, from whom all particulars relating to the work may be obtained. Sealed, endorsed tenders on official forms, which may be had from the architect, are to be sent to F. R. Pascoe, secretary, Education Office, Truro, on or before Dec. 22.

Dec. 22. Burnley.—*Erection of proposed technical school* in Omerod Road, Burnley, for the Education Committee. Drawings may be seen and specifications, bills of quantities, and forms of tender obtained at the office of the Borough Engineer, G. H. Pickles, A.M.I.C.E., on payment of £1 1s. Tenders endorsed "Wagon Shed," to be delivered and addressed to the Chairman of the Education Committee, must be delivered at the Town Clerk's Office, Town Hall, not later than 9 a.m. on Dec. 22.

Dec. 26. Talgarth, R.S.O.—*Erection of two semi-detached* cottages on the Brecon and Radnor Asylum Estate. A plan and specification of the work to be done may be seen, and any particulars obtained upon application at the Clerk's Office in the Asylum, any week-day excepting Saturday, between 10 a.m. and 4 p.m. Tenders, sealed and endorsed "Tender for Cottages," must be deliered addressed to A. J. Astbury, clerk to the Visiting Committee, not later than noon on Dec. 26.

Dec. 27. Penygraig.—*Alterations and improvements* to the Old School at Penygraig, for the Rhondda U.D.C. Plans and specifications may be seen and bills of quantities obtained at the office of J. Rees, architect, Hillside Cottage, Pentre, Rhondda, on the deposit of £2 2s. with the Accountant at the Council Offices, Pentre. Sealed tenders (endorsed "Tender for Penygraig School Alterations"), accompanied by the priced quantities under separate cover, must reach T. W. Berry, Director of Education, Council Offices, Pentre, Rhondda, not later than the first post on Dec. 27.

Dec. 28. Doncaster.—*Erection of two shops* in Silver Street, for the Corporation of Doncaster. Specification and form of tender may be had from the Borough Surveyor on payment of £1 1s. Tenders must be delivered at the Borough Surveyor's Office, Mansion House, Doncaster, before noon on Dec. 28, endorsed "Tender for New Shops," and addressed to the Chairman of the Street Improvements Committee.

Dec. 28. Hove.—*Erection of public library* in Church Road, Hove, in accordance with plans, specification and bill of quantities prepared by the architects, P. Robinson, F.R.I.B.A., and W. Alban Jones, of Yorkshire Post Chambers, Leeds. Plans and specification may be seen and bills of quantities, at the office of H. H. Scott, borough surveyor, on payment of £1 1s. Tenders, on forms supplied, endorsed "Tender for Erecting Proposed Library," addressed to H. Endacott, town clerk, Town Hall, Hove, will be received up to 6 p.m. on Dec. 28.

Dec. 28. Ripley.—*Construction of new offices* and public urinal, and also an additional staircase, at the Town Hall, Ripley, Derby, for the Ripley U.D.C. The drawings can be seen, and specification, bill of quantities, and form of tender obtained, from G. W. Bird, C.E., surveyor, Town Hall, Ripley, Derby, upon payment of £2 2s. Sealed tenders, endorsed "Town Hall Alterations," must be delivered at the office of G. M. Capon, clerk to the Ripley U.D. Council, Public Offices, Ripley, Derby, on or before Dec. 28.

Dec. 29. Carmarthen.—*Erection of new workhouse* at Carmarthen. Contractors desirous of tendering are requested to send in, not later than Dec. 8 next, their names and addresses to A. I. Jones, Board's architect, 2, Spilman Street, Carmarthen, together with a cheque for £2 2s. for bill of quantities. Sealed tenders (marked "New Workhouse") must be delivered to J. Saer, clerk to the Guardians, 7, Hall Street, Carmarthen, not later than Dec. 28. The tenders will be opened at the Board meeting on Dec. 29.

Dec. 29. Seacombe Ferry.—*Erection of new ferry workshops* at Seacombe Ferry, for the Wallasey U.D.C. Drawings and specifications may be seen, and form of tender and bill of quantities obtained, on application to W. H. Travers, engineer and surveyor, Public Offices, Egremont, Cheshire, on payment of a deposit of £1. Tenders in sealed envelopes, endorsed "New Workshops, Seacombe Ferry," to be addressed to H. W. Cook, clerk and solicitor, and forwarded through post for delivery at the Public Offices not later than Dec. 29.

Dec. 29. Leicester.—*Erection and completion* of farm buildings at the New Asylum, together with farm bailiff's house, and other works connected therewith, at Narborouvh, near Leicester. Conditions of contract, quantities, and form of tender may be obtained from Everard, Son & Pick, architects, 6, Millstone Lane, Leicester, on payment of a sum of £2 2s. Sealed tenders, upon the forms supplied, to be sent to W. J. Freer, clerk to the Committee of Visitors, 10, New Street, Leicester, not later than 10 a.m. on Dec. 29, addressed to the "Chairman of the Asylum Committee," and endorsed "Tender for Farm Buildings."

Dec. 31. London, S.E.—*Erection of a branch library* at Hither Green S.E. The drawings and specifications of the building can be inspected either at the offices of H. Hopton, architect, 37, Ringstead Road, Catford, S.E., or of C. O. Robson, quantity surveyor, 33, King Street, Cheapside, between 10 and 4. A copy of the quantities can be obtained at the office of the quantity surveyor on payment of £2 2s. Sealed tenders, accompanied by the priced bills of quantities (also sealed), and addressed to the Clerk to the Committee, are to be delivered at the Town Hall, Catford, on or before Dec. 31. Fair wages clause.

Jan. 1. Nottingham.—*Erection of a mixed school* and additions to the infants' school, Sneinton Boulevard, for the City of Nottingham Education Committee. Plans may be seen at, and copies of the specification, bill of quantities, and form of tender obtained from F. B. Lewis, city architect, Guildhall, on payment of a deposit of £2 2s. Sealed tenders, addressed to W. J. Abel, clerk, Education Offices, Victoria Street, to be delivered not later than 10 a.m. on Jan. 1. Fair wages clause.

Jan. 1. Norwich.—*Supply of 160,000 red bricks* equal in all respects to the sample which may be seen of A. E. Collins, M.Inst.C.E., city engineer, Guildhall, Norwich; delivered as, when, and in such quantities as are required, alongside the sewage works in progress between Old Lakenham and Hall Road, Norwich. Tenders, on the forms supplied, enclosed in envelopes sealed with sealing wax, endorsed "Bricks," and addressed to the Chairman of the Sewerage Committee, must be delivered to the City Engineer not later than 10 a.m. on Jan. 1.

Jan. 2. Neston.—*Erection and completion* of a small library at Neston, for the Neston and Parkgate U.D.C. Plans and specifications may be seen and form of tender and bills of quantities obtained upon application to Green, Knowles & Russell, architects, 19, South John Street, Liverpool. A deposit of £1 1s. is required. Sealed tenders, endorsed "Tender for Library," must be delivered to C. E. Senior, surveyor, The Town Hall, Neston, on or before Jan. 2.

Jan. 2. Hambledon.—(*a*) *Carrying out certain small additions* to the young women's dormitory, and (b) the erection of a range of earth closets and the extension of the lavatory accommodation in the men's quarters, at the Union Workhouse, Hambledon, for the Guardians. A plan and specification of the proposed work can be seen on application to E. L. Lunn, Board's architect, 36, High Street, Guildford. Sealed and endorsed tenders are to be delivered to F. Smallpeice, clerk to the Guardians, 138, High Street, Guildford, not later than 2 on Jan. 2.

Jan. 8. Greenland.—*Erection of new Council* school at South Moor, Greenland, for about 950 scholars. Plans, specification, and general conditions of contract may be seen and bills of quantities obtained at the office of Clark & Moscrop, architects, Feethams, Darlington. Sealed tenders, endorsed "South Moor, Greenland Council School Tender," are to be sent on or before Jan. 8, addressed to the Secretary, Elementary Education Department, Shire Hall, Durham.

Jan. 10. Dunning.—*Erection of a police station* at Dunning. The plans and specifications will be seen at the office of D. Smart, architect, Perth, from whom schedules of measurement and further particulars will be obtained, and endorsed sealed tenders must be lodged with D. Marshall, County clerk, County Buildings, Perth, on or before Jan. 10. The police officer at Dunning will point out the site and show copies of the plans to intending contractors.

Jan. 12. Gateshead.—*Erection of additional classrooms*, laboratory, &c., at the Secondary Schools, Durham Road. Plans and specification can be seen and bill of quantities obtained at the office of N. P. Pattison, borough engineer, Town Hall, Gateshead, on payment of £1 1s. Tenders, sealed and endorsed "Tender for Additions to Secondary Schools," to be sent in on or before Jan. 12.

Jan. 14. Gosforth.—*Erection of a new Council school*, to accommodate 400 scholars at Gosforth, near Newcastle-on-Tyne. Contractors desirous of tendering for the work should forward particulars of their name and address to C. Williams, secretary to the Education Committee, Pearl Buildings, Newcastle-on-Tyne, not later than Dec. 20, together with a deposit of £2 2s. Plans of the work may be inspected at the Committee's Offices, and tenders, endorsed "Tender for Gosforth Council School," must be forwarded to the Secretary not later than 3 p.m. on Jan. 14.

Jan. 15. Enfield.—*Erection of a junior mixed school* at Bush Hill Park, Enfield. Applications for bills of quantities should be sent to G. E. T. Laurence, architect, 22, Buckingham Street, Adelphi, W.C., before Dec. 29, from which date the plans and specification can be seen at the above address. A deposit of £1 1s. should accompany the application. Sealed tenders, on the form supplied, must be delivered to N. Hepworth, clerk, Public Offices, Enfield, free of charge, not later than 12 noon on Jan. 15. The contractor whose tender is accepted will be required to enter into a bond with two sureties in the sum of £300 each for the due performance of the contract.

Jan. 17. London, S.E.—*Alterations and additions at the Infirmary*, Lower Road, Rotherhithe, S.E., according to plans and specification prepared by A. H. Newman, and quantities by W. T. Farthing & Son. Persons desirous of tendering for the works are required to send their names and addresses before Dec. 8 to E. P. Fenton, clerk to the Guardians, 283, Tooley Street, S.E., and to deposit with him a £50 Bank of England note. As soon after Dec. 8 as possible, forms of tender, bills of quantities, etc., and all other necessary information will be supplied to those persons whose names, addresses, and deposits have been supplied to the Clerk to the Guardians. The specification and plans of the works will then be open for inspection by such persons at the architect's offices, A. H. Newman, 31, Tooley Street, London Bridge, S.E., on production of the form of tender. Fair wages clause. Sealed tenders, endorsed "Tender for Alterations and Additions, Infirmary," must be delivered personally to E. P. Fenton, clerk, 283, Tooley Street, S.E., at 6 p.m. on Jan. 17, accompanied by the bills of quantities, &c., in a separate sealed envelope. The tenders will be opened and considered at 7 p.m. at the meeting of the Guardians on Jan. 17, at their Board Room, at which place, date, and time a responsible member of the firm tendering must be in attendance.

Jan. 22. Eltham.—*Erection of a refreshment house* at Avery Hill, Eltham, for the L.C.C.. Full particulars and also information as to the conditions to be observed by tenderers, will be given in the "London County Council Gazette" of Dec. 17, which can be obtained from P. S. King & Son, 2 and 4, Great Smith Street, Westminster (price 1d., post free 1½d. a copy). Tenders must be upon the official forms, and no tender will be received after 10 a.m. on Jan. 22.

April 2. Bombay.—*Construction of a reclamation* between Mazagon and Sewri, for the Trustees of the Port of Bombay. The contract will include the building of a rubble masonry quay wall about 12,600ft. long on piled foundations and the reclamation of about 518 acres of the foreshore; such reclamation to be effected by silt or mud pumped or dredged from the bed of the harbour, and covered with a layer of good earth. Copies of the specifications and drawings of the work can be obtained from the Chief Engineer, Bombay Port Trust, Ballard Road, Bombay, or from Sir J. Wolfe Barry and A. J. Barry, trustee's consulting engineers, 7, The Sanctuary, Westminster, S.W., on payment of £5 sterling. Tenders, which must be endorsed "Tenders for Mazagon-Sewri Reclamation," and accompanied by a deposit of Rs. 10,000 (£666), will be received by the Secretary, Bombay Port Trust, Bombay, up to 5.30 p.m., or by the Trustees' Consulting Engineers up to noon on April 2.

No date. Bridlington.—*Erection of a theatre* on the New Spa, Bridlington. Persons desirous of tendering are requested to send in their names to F. Lowther & Walker, architects, York Chambers, 71, Lowgate, Hull, together with a deposit of £2 2s. Bills of quantities and further particulars will be sent to such depositors only.

ENGINEERING.

Dec. 21. Derby.—*Erection of new electric power station*, Silk Mill Lane. Plans may be seen, and form of tender, specification, and bill of quantities obtained, on application at the office of J. Ward, M.Inst.C.E., borough surveyor, Babington Lane, Derby, and upon the deposit of £1 1s. Tenders, endorsed "Power Station," are to be delivered in the special envelope provided for the purpose at the office of G. T. Lee, town clerk, Town Clerk's Office, 15, Tenant Street, Derby, not later than 10 a.m. on Dec. 21.

Dec. 22. Guernsey.—*Construction of the proposed extension* of the pier and causeway in Bordeaux Harbour, The Vale. Plans and specifications may be seen, and forms of tender and other information obtained, on application to J. H. Duquemin, States engineer, States Office, Guernsey. Sealed tenders, addressed to J. N. Brouard, supervisor, and endorsed "Tender for Bordeaux Pier Extension," must be delivered so as to reach the State Office on or before Dec. 22, at noon.

Dec. 22. Stockport.—*Electric light wiring and telephones* in connection with the new Town Hall, in accordance with specifications and schedules prepared by A. B. Thomas, architect, 5, Queen Anne's Gate, Westminster, S.W. Copies of the particulars for tender can be obtained of R. Hyde, town clerk, Town Clerk's Office, Stockport, or at the offices of the architect, on payment of a deposit of £1 1s. for each separate list. Tenders must be delivered to R. Hyde not later than noon on Dec. 22. Fair wages clause.

Dec. 22. Porthcawl.—*Construction of a concrete sea defence wall* at the Esplanade, Porthcawl, in length 216 lineal ft., or thereabouts, for the U.D.C., according to the plans and specifications prepared by R. W. Jones, the Council's engineer, which are deposited and may be inspected at the Council Offices, Porthcawl, by appointment with the said Engineer. Copies of specification and form of tender will be supplied to intending contractors upon receipt of £2 2s. The contractor whose tender shall be accepted shall enter into a contract and also a bond with two sureties in the form required by the Council and pay the cost of the same, not exceeding six guineas. Tenders, marked "Esplanade Sea Wall Extension," are to be sent to E. T. David, clerk to the above-named Council, Council Offices, Porthcawl, on or before Dec. 22.

Dec. 31. Brackley.—*Sinking a well* in the Borough of Brackley. Specification and forms of tender may be obtained and plans seen at the office of the Town Clerk at Brackley, and information and any further particulars may be obtained on application to J. Eunson, C.E., Northampton. Copies of specification may be obtained on payment of £2. Tenders, upon the forms supplied, must be delivered not later than 10 a.m. on Dec. 31, addressed to C. E. Barnes, town clerk, endorsed "Tender for Well."

Dec. 31. Ashton-under-Lyne.—*Construction of an embankment*, &c., for the formation of a reservoir, and for other works on and about the Chew Brook, 3½ miles or thereabouts from the Friezland Station of the London & North-Western Railway, for the Joint Committee of the Ashton-under-Lyne, Stalybridge, and Dukinfield (District) Waterworks. Drawings can be seen and copies of the specification, schedule, and form of tender may be obtained at the offices of G. H. Hill & Sons, civil engineers, Albert Chambers, Albert Square, Manchester, and 3, Victoria Street, Westminster, upon receipt of cheque for £5 5s. Sealed tenders, endorsed "Tender for Chew Reservoir and Works," must be addressed to and forwarded to W. H. Rothwell, secretary to the Joint Committee, Town Hall Chambers, Ashton-under-Lyne, on or before Dec. 31.

Jan. 1. Bray, Ireland.—*Supplying and erection of a high-tension* switchboard and instruments. Specification and form of tender may be obtained from W. J. U. Sowter, A.M.I.E.E., electrical engineer to the Council, on payment of a deposit of £2 2s. Tenders, sealed and endorsed "Switchgear," to be delivered to P. MacDonnell, clerk to the Council, Town Hall, Bray, Ireland, not later than 10 a.m. on Jan 1.

Jan. 3. York.—*Construction of the Selby and Goole Railway*, about 10 miles in length, for the North-Eastern Railway. The works comprise double-line railways chiefly on embankment (upwards of 1,000,000 cubic yards), with stations, station yards, warehouses, cottages, and other buildings, sidings, and bridges. The steelwork of the latter will amount to about 1,100 tons. Plans may be seen, and specification, detailed quantities, and form of tender obtained, on personal application at the office of W. J. Cudworth, Company's engineer, York. Sealed tenders, marked "Tender for Selby and Goole Railway," to be addressed to R. F. Dunnell, secretary, and delivered at his office at York not later than noon on Jan. 3.

Jan. 9. Worthing.—*Sinking a well* 115ft. deep, lined with iron cylinders, and the driving of headings and other works in connection therewith, for the Corporation. Plan and specification may be seen and form of tender obtained on application to F. Roberts, A.M.Inst.C.E., borough water engineer and surveyor. Sealed tenders, endorsed "Tender for Well," to be sent in to W. Verrall, town clerk, Municipal Offices, Liverpool Road, Worthing, not later than 12 noon on Jan. 9.

Jan. 10. Swansea.—*A two-ton portable high pedestal* hydraulic crane with a radius of 40ft., for the Swansea Harbour Trustees. Further particulars can be obtained on application to A. O. Schenk, Mem.Inst.C.E., Trustees' engineer, at the Harbour Offices, Swansea. Tenders, sealed and marked "Hydraulic Crane," should be delivered to T. Strick, clerk, Harbour Offices, before 10 a.m. on Jan. 10.

Jan. 16. Spain.—*Construction of an iron bridge* over the river Arevalillo, on the road from Villacastin to Vigo, at the estimated cost of 56,975 pesetas (about £2,071). Tenders will be opened on Jan. 16 at the Directorate General of Public Works, Madrid. Plans and specifications are on view at the above-mentioned office; conditions of tender are set forth in the "Gaceta." Local representation is necessary. The "Gacetas" may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

Jan. 19. Bridlington.—*Supply and erection of two sets* of deep-well pumping machinery, to be driven by steam, suction gas, or electricity, for the Corporation. Copies of specification, forms of tender, and permits to view the site, may be obtained of A. E. Matthewman, town clerk, Town Hall, Bridlington, on payment of £2. Tenders, endorsed "Tender for Pumping Machinery," are to be addressed to the Chairman of the Waterworks Committee and delivered at the Town Clerk's Office not later than Jan. 19.

IRON AND STEEL.

Dec. 24. Nottingham.—*Supply and fixing* of about 147 lineal yds. of three-rail wrought iron unclimbable hurdle fencing and gates at the foot of the Castle Rock, Castle Boulevard, for the Castle Museum and School of Art Committee. Plans may be seen and copies of the specification and form of tender obtained from F. B. Lewis, city architect, Guildhall, on payment of a deposit of £1 1s. Sealed tenders to be sent in not later than 10 a.m. on Dec. 24, addressed "The Town Clerk, Guildhall, Nottingham," and endorsed "Tender for Hurdle Fencing, Castle Boulevard." Fair wages.

Jan. 7. Beckenham.—*Supply of about 250 lin. yds.* of W. I. unclimbable fencing, 6ft. high, together with ornamental entrance gates, for the U.D.C. Specifications and forms of tender obtained on application to J. A. Angell, surveyor, on the production of a receipt from the Collector (who attends his office, daily from 9 to 10 a.m. only, except on Tuesdays, when his hours are from 9 a.m. to 1 p.m.), for a deposit of £1. Tenders, duly sealed and endorsed "Tenders for Railings and Gates," to reach F. Stevens, clerk to the Council, not later than 4 p.m. on Jan. 7.

ROADS AND CARTAGE.

Dec. 20. London, S.E.—*Supply of 5,000ft. of 8-in. by 12-in.* grey Norwegian edge straight kerb and 500ft. of 8-in. by 12-in. Norwegian circular kerb of various radii, for the Lambeth Borough Council, to be delivered as directed to either of the Council's depôts at St. James's Road, Brixton; Fenwick Place, Stockwell, or Cobbett Street, Clapham. Further information, if required, may be obtained upon application to the Borough Engineer at No. 346, Kennington Road, S.E., any weekday, between 10 and 12 noon, from whom forms of tender can also be obtained. Sealed tenders, endorsed "Tender for Norwegian Kerb," to be delivered at the Town Hall, Kennington Green, London, S.E., not later than 12 noon on Dec. 20.

Dec. 20. Plymouth.—*Construction of a new joint road*, including surface water drains, sewers, manholes, and other works, on the Antony and Carbeile Building Estates, Torpoint. Contractors are requested to send their names to either W. J. Carder, surveyor to the Antony Building Estate, 24, Lockyer Street, Plymouth, or R. M. Luke, surveyor to the Carbeile Building Estate, 15, Princess Square, Plymouth, on or before Dec. 20.

Dec. 24. Cardiff.—*Private street improvement works* in Brook Lane, Ely, in accordance with specification, which may be seen, and bills of quantities obtained on application to J. Holden, A.M.I.C.E., surveyor, Park House, 20, Park Place, Cardiff. The person whose tender is accepted wil be required to enter into a contract (the draft of which is attached to the specification) and to give a bond, with two approved sureties, for the due performance of the contract. Tenders, sealed and endorsed, to be sent to M. Warren, clerk, Park House, Cardiff, not later than 12 noon on Dec. 24.

Dec. 27. Leeds.—*Paving and flagging* of Lucas Place, Back Lucas Street, and Back Hartley Grove. Drawings may be seen at the City Engineer's Office, Municipal Buildings. Forms of tender and bills of quantities may be obtained, and copies of the documents forming the contract inspected, on application at the Highways Office, 155, Kirkstall Road. Sealed tenders, endorsed "Tender for Private Street Works," and addressed to the Highways Committee, must be delivered at the Town Clerk's Office, Town Hall, Leeds, not later than 10 a.m. on Dec. 27.

Dec. 27. London, N.E.—*Executing tar and wood block pavings*, erection of terrace wall and entrance gates, and sundry other works at the Children's Homes at Chipping Ongar, Essex. The specification, conditions of contract, and plans may be seen of F. R. Coles, clerk to the Guardians, Clerk's Offices, Hackney Union, Homerton, N.E., by persons desirous of tendering, and bills of quantities and form of tender will be furnished upon deposit with him of the sum of £1 1s. The contractor will be required to give approved security for the due performance of the contract in a bond, the form of which may be seen at the above office. Sealed tenders, endorsed "Pavings, Building, &c., at Ongar," must be delivered not later than 2 p.m. on Dec. 27.

Dec. 31. Leyton.—*Making-up, kerbing, and paving* certain private streets within the district, for the U.D.C. The paths are to be paved with Patent Victoria Indurated and Patent Aberdeen Adamant Stone, and certain passageways are to be paved with blue Staffordshire paving bricks Specification, quantities, and form of tender may be obtained on application to W. Dawson, M.I.C.E., Council's surveyor, Town Hall, Leyton, between 10 and 4 (Saturdays 10 and 12). Sealed tenders in special endorsed envelopes supplied with the forms, must be delivered at the meeting of the Council to be held on Dec. 31, at the Town Hall, Leyton, at 7 p.m.

Jan. 3. Banchory.—*Macadamizing, &c.*, of 859 lineal yds. or thereabouts of streets within the burgh, including channels, kerbing, gullies, footways, and crossings thereon. The Burgh Road Surveyor will meet intending offerers at Viewmount Road (west end), on Dec. 29, at 1.30 p.m., to point out the works. Specifications may be seen at the office of J. Merson, town clerk, High Street, Banchory, where tenders should be lodged not later than Jan. 3.

Jan. 5. London, W.—*Paving with wood of* Clifton Gardens, the portion of Warwick Avenue in front of St. Saviour's Church, a portion of Porchester Gardens, and a portion of Amberley Road opposite the schools there, for the Paddington Borough Council. Printed conditions, specification, and form of tender and further particulars may be obtained upon application between 10 a.m. and 4 p.m. (Saturdays 10 a.m. and 1 p.m.) at the office of, or by letter addressed to, the Borough Surveyor, Town Hall, Paddington, W. No tender will be considered unless made strictly in accordance with and on one of the printed forms issued, and it must be sealed, endorsed according to the description of contract, addressed to the Town Clerk, and delivered at the Town Hall, Paddington, W., on or before Jan. 5.

Jan. 7. Batley.—*Levelling, paving, flagging*, and completing of each of the following streets:—Borough Road, Fleece Street, Cooper Street, Ambler Place, Fox Place. Plans, sections, specifications, and conditions of the said works respectively may be seen, and forms of tender, together with schedules of quantities and other particulars, obtained at the office of O. J. Kirby, borough engineer, Town Hall, Batley. Sealed tenders, on the forms provided, endorsed "Tender for ——," to be delivered to J. H. Craik, Town Clerk's Office, not later than Jan. 7.

Jan. 8. London, N.—*Roadwork and platelaying* required by the L.C.C., for the reconstruction for electric traction on the conduit system of its existing tramways in Holloway Road, City Road, and Hackney Road; and on the overhead trolley system of the portion of the existing tramways in Bow Road, within the Borough of Poplar. The total length of the above-mentioned lines is about 9¾ miles of single track, of which about 8¼ miles single will be reconstructed on the conduit system. Full particulars and also information as to the conditions to be observed by tenderers will be given in the "London County Council Gazette" of Dec. 10. The "Gazette," which is published weekly, contains particulars of all tenders invited by the Council, and can be obtained from P. S. King & Sons, 2 and 4, Great Smith Street, Westminster, S.W., price 1d., post free 1½d., an issue, or for the year a prepaid subscription of 6s. 6d. Tenders must be upon the official forms to be obtained from the Chief Engineer, County Hall, Spring Gardens, S.W., and no tender will be received after 10 a.m. on Jan. 8.

SANITARY.

Dec. 26. Littlehampton.—(*1*) *The construction of a screening chamber* on the Workhouse main drain; (2) the erection of a covered way; (3) the erection of boundary walls and fences, and making-up grounds, for the Guardians of the East Preston Union. Plans and specifications may be seen of H. M. Potter, architect, 41a, Warwick Street, Worthing. Tenders, endorsed "Tender for Covered Way, &c.," must reach A. Shelley, clerk, Town Offices, Littlehampton, not later than Dec. 26.

Jan. 2. Ashwell.—*Sewerage works* for the Parish of Ashwell. The works comprise about 2½ miles of stoneware pipes (chiefly 12-in. and 9-in.), with manholes and other appurtenant works; also small sedimentation tanks, and laying-out 9 acres of land for filtration. Plans and specifications can be seen at the offices of Elliott and Brown, engineers, Burton Buildings, Parliament Street, Nottingham, and copies of the bill of quantities and form of tender obtained on deposit of £2 2s. (by cheque). Sealed and endorsed tenders to be delivered to A. Sharpe, clerk to the Council, Royston, Herts, on or before the first post on Jan. 2.

Jan. 13. Kettering.—*Provision of distributing apparatus*, on rectangular percolation filter beds, for the U.D.C. Full particulars of requirements may be obtained from the Council's Surveyor. Tenders to be delivered at the office of T. R. Smith, engineer and surveyor, Surveyor's Office, Market Place, Kettering, not later than Jan. 13.

Jan. 14. London, E.—*Supply of stoneware sewer* and drain pipes, &c., iron casings for sewerage and drainage works, for the Metropolitan Borough of Poplar. Forms of tender, specifications, and all particulars may be obtained on application to H. Heckford, A.M.I.C.E., borough surveyor, at the Council Offices, on payment of a deposit of £1 1s. in cash. Tenders, endorsed with the description of work tendered for, to be delivered to L. Potts, town clerk, Council Offices, High Street, Poplar, on or before noon on Jan. 14. Fair wages clause.

Jan. 22. Sowerby Bridge.—*Supply, delivery, and filling* the remaining 12 bacteria beds with filtering medium; quantity about 9,000 cubic yds., at the Sewage Works, Milner Road, Sowerby Bridge. for the U.D.C. Conditions and samples of filtering medium, &c., may be seen at the Engineer's Office, Hollings Mill Lane, Sowerby Bridge, by appointment. Specification and quantities may be obtained on application to C. L. Whitehead, C.E., M.E., engineer, Sowerby Bridge, on payment of a £5 Bank of England note only. Tenders, endorsed "Bacteria Beds," and addressed and delivered to R. W. Evans, clerk and solicitor to the Council, Commercial Bank Chambers, Halifax, in sealed envelopes, not later than Jan. 22.

Jan. 30. Weaste.—*New sewage pumps* to two large pumping engines at the Salford Sewage Works, Weaste. Drawings and specifiations may be obtained from the Borough Engineer, Town Hall, Salford, on payment of £1. Tenders, endorsed "Sewage Pumps," and addressed to "The Chairman of the Rivers Committee, Town Hall, Salford," must be delivered to L. C. Evans, town clerk, Town Hall, Salford, not later than 12 noon on Jan. 30.

MISCELLANEOUS.

Dec. 20. Nottingham.—*Supply of the following goods* and materials for delivery during the ensuing year, carriage paid, at the various gas stations, chemical works, or stores, or at any railway station within the Nottingham gas supply district, for the Gas Committee:—(a) Cast-iron pipes and specials; (b) pig lead, lead and compo. pipe, white, red, and chemical sheet lead; (c) wrought-iron and steel; (f) wrought-iron tubes and fittings; (g) brass cocks and malleable iron levers (h) small iron castings, retort fittings, &c.,; (i) purchase of old cast and wrought scrap iron, old copper, brass, &c.; (k) paints; (l) oils. Specifications and forms of tender may be obtained, and samples seen, on application to the Engineer and General Manager, at the Gas Offices, George Street, Nottingham. Tenders to be addressed to S. G Johnson, town clerk, and delivered at the Guildhall, Nottingham, not later than Dec. 20.

Dec. 29. Bury.—*Supply and delivery* of the following materials:—Tramway rails and fishplates; tie-bars, fish bolts and nuts; points and crossings; sole or anchor plates; copper rail bonds; granite setts; cement. Specifications and bills of quantities, with forms of tender, can be obtained on application at the office of A. W. Bradley, A.M.I.C.E., borough engineer and surveyor, on payment of £2 for each specification. Sealed tenders, endorsed "Tramway Rails, &c.," or as the case may be, are to be forwarded to J. Haslam, town clerk, Municipal Offices, Bank Street, Bury, and addressed to the Chairman of the Tramways Committee, so as to be received not later than Dec. 29.

Jan. 7. London, S.W.—*Execution of works* and the supply of materials from March 31 next, for one, two, or three years, as per forms of tender, at the option of the Council, for the Council of the Metropolitan Borough of Wandsworth:—(1) artificial stone; (2) blue bricks; (3) castings, &c.; (4) cement; (9) granite kerb and setts; (10) gravel and flints; (12) hire of steam road-rollers and scarifiers; (15) iron bars and other materials for blacksmith's work; (16) lime, bricks, &c.; (24) slag or scoriæ paving blocks; (25) stoneware pipes, &c.; (27) tar-paving works and materials; (28) Thames ballast and sand; (29) timber. Fair wages clause. Specifications and forms of tender may be obtained and form of contract seen of H. G. Hills, town clerk, Council House, Wandsworth, S.W., between 10 a.m. and 4 p.m. (Saturdays 10 till 1). Tenders (each enclosed in a separate envelope) are to be delivered, under seal, at the Council House, endorsed "Tender for ——," on or before Jan. 7. No tender will be received unless it is made upon one of the printed forms issued from these offices.

Dec. 28. Dublin.—*Construction of about 14 miles of pipe sewers*, ejector stations, rising mains, air transmission mains, air-compressing station, together with the supply and erection of various machinery and auxiliary works connected therewith, chiefly in the East Clontarf and West Clontarf Wards of the City of Dublin. The drawings, specification, bills of quantities, and forms of tender may be inspected at the office of the City Engineer, City Hall, Dublin, and at the office of G. Chatterton, M.Inst.C.E., consulting engineer, 6, The Sanctuary, Westminster, between 10 a.m. and 5 p.m. daily, Saturdays excepted, and a limited number of copies of the said documents may be obtained at the offices aforesaid on payment of the sum of £5 5s. (Crossed cheques only will be received in payment.) Tenders, sealed and endorsed on the envelope "Tenders for Clontarf Sewerage," must be addressed to the Chairman of the Improvements Committee, City Hall, Dublin, and delivered before 12 noon on Dec. 28. With each tender must be submitted the names of two sureties who will be prepared to execute a joint and several bond for the due performance of the contract in a sum of £10,000.

TOO LATE FOR CLASSIFICATION.

Dec. 20. Paddock.—*Erection of eight dwelling-houses* in Branch Street, Paddock. Plans may be seen and quantities obtained of Lunn & Kaye, architects and surveyors, Milnsbridge. Sealed and endorsed tenders must be delivered to them not later than 5.30 p.m., free of charge, on Dec. 20.

Dec. 21. Valetta.—*Supply of stoneware pipes and specials.* Sealed tenders will be received at the office of the Receiver-General and Director of Contracts, Valetta, up to 11 a.m. on Dec. 21. Tenders are to be accompanied with a deposit of £50, to be made in the office of the Crown Agents by tenderers residing in Great Britain not having a representativeg in Malta, and in the office of the Receiver-General by local tenderers. Contract fees to be paid by the contractor. Particulars, specification, &c., may be obtained on application to W. Casolani, Receiver-General and Director of Contracts, or to the Crown Agents for the Colonies, Whitehall Gandens, London.

Dec. 21. Sedgefield.—*Execution of a scheme of main sewerage* and sewage disposal for Bishop Middleham, for the Sedgefield R.D.C. The proposed works in this contract comprise the furnishing and laying of about 2,200yds. of 12, 9, 8, 7, and 6-in. fireclay and cast-iron pipe sewers with Gaskin and cement joints, with manhole and lamphole shafts, storm overflow and screening chambers, bacterial tanks and filters, fencing, cart-road, &c. Contractors desirous of tendering are requested to send their names and addresses not Tyne, accompanied by a cheque for £3. after which engineers, 3, St. Nicholas Buildings, Newcastle-on-Tyne, accompanied by a cheque for £3, after which ful partilculars and quantities will be forwarded. The engineers will arrange in due course to locally meet the intending contractors and go over the route of the said works and explain plans and specification. Sealed tenders, endorsed "Tender for Bishop Middleham Sewerage," must be sent to J. W. Lodge, clerk, Union Offices, Sedgefield, Ferryhill, not later than 10 a.m. on Dec. 21.

Dec. 28. Dublin.—*Supply of 320yds. of wrought-iron railings* to enclose Recreation Ground at Dollymount, for the Improvements Committee. The railing are to be made and supplied in 6-ft. sections, having round iron bars passed through horizontal bars and rivetted underneath, in accordance with the design prepared by the City Engineer, copy of which, with a full memorandum of particulars, can be had on application to P. Tobin, secretary, any day between 11 and 4; Saturdays 11 and 1. Tenders, addressed to the Chairman, Improvements Committee, City Hall, and endorsed "Tender for Wrought-Iron Railings," must be received by the Secretary not later than Dec. 28, at or before 12 noon. Fair wages clause. The railings shall be of Irish manufacture.

Dec. 28. Warwick.—*Erection of a workshed at* the Workhouse, Warwick, according to plan and specification, which may be seen at the office of F. P. Trepess, F.I.A.S., 1, Church Street, Warwick, any day (except Saturday) between 10 a.m. and 4 p.m. Tenders, sealed and endorsed "Tender for Workshed," addressed to C. H. Passman, clerk to the Guardians, 48, Bedford Street, Leamington Spa, must be delivered not later than 9 a.m. on Dec. 28.

Dec. 29. Melton Mowbray.—*Construction of a girder bridge*, with brick abutments, iron palisading, and road metalling, &c., complete, over the Scalford Brook, from Regent Street to Brook Street, for the U.D.C. Plans and specifications may be seen at the office of E. Jeeves, surveyor to the Council, Nottingham Street, Melton Mowbray, and applications for quantities and particulars of tendering must be sent to him not later than Dec. 29.

Dec. 31. Stockton.—*Re-seating of the Board-Room*, for the Guardians of the Stockton Union. Full particulars and forms of tender to be obtained from J. Rodham, 16, Finkle Street, Stockton-on-Tees. Tenders duly endorsed "Tender for Re-seating," to reach F. B. Watson, clerk to the Guardians, Stockton-on-Tees, not later than Dec. 31, at noon.

Dec. 31. Wemyss.—*Erection of new school* at East Wemyss. Schedules of quantities may be obtained from A. W. Taylor, clerk to the School Board, on the depositing of £1 1s. Sealed offers to be lodged with the Clerk to the Board, East Wemyss, not later than 10 a.m. on Dec. 31, marked "Tender Wemyss School."

Jan. 2. Epping.—*Construction of sewage disposal works* and the laying of about 2,500 yds. lineal of pipe sewers, with manholes and contingent works in the parish of Chigwell, for the Epping R.D.C. Drawings can be seen, and further particulars and bills of quantities obtained, at the office of H. Tooley, A.R.I.B.A., Buckhurst Hill, upon the deposit of £10. Applications for bills of quantities must be made before Dec. 19. Tenders to be on the forms supplied, and sent in the envelopes provided, to R. D. Trotter, clerk, Epping, Essex, on or before 6 p.m. on Jan. 2.

Jan. 18. Wallsend.—*Erection of police buildings.* Persons desirous of tendering are requested to send in their names to J. A. Bean. Bills of quantities will be forwarded on payment of a deposit of £2 2s. Applications to be sent to J. A. Bean, County architect, The Moot Hall, Newcastle-on-Tyne, where drawings can be seen. Sealed tenders, sent in the envelopes provided, to be delivered not later than 4 p.m. on Jan. 18.

the whole embracing a total superficial area of 57,000 square feet.

To be Let, in One Block, on Building Lease for 80 years from March 25, 1907, when possession will be given and 18 months' peppercorn allowed.

MESSRS. DANIEL WATNEY & SONS are instructed by the Mercers' Company, with the approval of the Board of Education, to LET the above by AUCTION at the Mart, E.C., on Thursday, January 10 next, at Two o'clock.

Particulars, with plan and conditions of letting, may be obtained of Sir John Watney, Mercers' Hall, Cheapside, E.C.; at the Mart; and of the Auctioneer, 33, Poultry, E.C.

FOR SALE.—FREEHOLD BUILDING LAND, about 3¾ acres with large frontage to mainroad; room for 90 houses Also remainder of brickfield with three-quarter millions of bricks to make up. Sheds, offices, and complete plant, cart and horse. Price, £3,000.—Address, Mecklenburg, Hounslow.

FOR SALE, an old established Joiners' and Builders' Business in the North of England. Price for plant, stock-in-trade, &c., £500. Further particulars apply to F. Chappell, Auctioneer and Valuer, Huddersfield.

"THE ARCHITECTURAL REVIEW"

For DECEMBER,

NOW ON SALE

PRINCIPAL CONTENTS:

Some Aspects of Sicilian Architecture. II.
The Churches. By Ronald P. Jones. With 10 Illustrations.

The Architectural Association School of Architecture.
With 5 Illustrations.

Current Architecture.
"White Webbs," Hadley Wood. J. L. Williams, Architect. "Little Court," Farthingstone, Northants. Walter Cave, Architect. With 12 Illustrations.

A Sketch of Irish Ecclesiastical Architecture. VI.
Irish Romanesque. Part III. A. C. Champneys. With 20 Illustrations.

The Practical Exemplar of Architecture. VIII.
Gothic Canopies. With 6 Illustrations.
Canopy over the Tomb of Bishop Gavin Dunbar, St. Machar's Cathedral, Aberdeen. Measured and drawn by R. J. Johnston.
Canopies over Stalls in the Chapel of King's College, Old Aberdeen. Measured and drawn by R. J. Johnston.

The New War Office.
Clyde Young. With 17 Illustrations.

J. T. Micklethwaite, F.S.A., Architect.
W. Niven.

Notes.
The New Westminster. J. C. Paget.

Books.

PRICE 1/- NETT.
ANNUAL SUBSCRIPTION 16/-

Of all Booksellers and Newsagents, or direct from the Publishers,

6, GREAT NEW STREET, FETTER LANE, E.C.

Situations

are always hard to get, and no one realises this more than men who are out of a berth.

If you are at the present time **Seeking a Situation** or if you wish to better your present position you owe it to yourself to neglect no opportunity of obtaining a berth which offers itself.

THE "BUILDERS' JOURNAL" EMPLOYMENT REGISTER

offers you exceptional facilities for making your requirements widely known.

Those who have used our columns when advertising for fresh berths have expressed the greatest satisfaction at the results they have obtained, and we append a letter received from one of them:—

"Kindly remove my name from your Employment Register. I am glad to say I have obtained a berth through its agency, for which I am obliged to you."

Every week—we might say every day—we get fresh evidence that employers consult the "Builders' Journal" Employment Register, and appended are a **selection from the letters received lately.**

"Kindly put advertisers Nos. 2187, 2215 and 2229 into communication with us and oblige."
From a well-known firm of *Provincial Architects.*

"Kindly instruct Nos. 1921, 1948, 1956, 1990-2002, 2021, 2024. 2042 and 2044 to send us particulars of wages required and qualifications, &c."
From a *Builder & Contractor.*

"Please put me into communication with advertiser No, 2182, Clerk of Works and Draughtsman,"
Writes a *Prominent Architect.*

"Please ask No. 2099 to forward references, stating capabilities and wages required."
From a *Somersetshire Builder & Contractor.*

The above letters speak for themselves, and it only remains for you to give the Employment Register a trial, and below we give full particulars of the cost of making your requirements known.

For 3s. we give three insertions (in a four-line advertisement) in our "Appointments Wanted" Columns, and also 6 insertions in the "EMPLOYMENT REGISTER" (see page xxviii).

VOLUMES I. to XXI. of
THE BUILDERS' JOURNAL
Handsomely bound in cloth gilt 7/- each.
Binding Cases for any of the above Volumes can now be obtained, price **1/9** each.

NOTICE TO OUR SUBSCRIBERS.

THE INDEX OF "THE BUILDERS' JOURNAL."

The Title Pages and Index to any volume of "THE BUILDERS' JOURNAL" may be had free, upon application being made to the Office, Great New Street, enclosing 1d. stamp to cover postage of same.

SPECIAL NOTICE.

Owing to the Christmas Holidays "The Builders' Journal" for next week will close for press on Friday, December 21st, at 12 o'clock noon, and copy for all Advertisements should reach this office not later than first post on Friday morning. Advertisements for the Miscellaneous, Appointments Wanted and Vacant Columns for that issue will be accepted up to 5 o'clock on Friday evening.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

ARCHITECT'S JUNIOR or IMPROVER (23), 5½ years' experience; plans; working drawings; details, colouring, &c.—William Buchanan, Clifton, Motherwell, N.B. 2241

ARCHITECT'S ASSISTANT (25) desires ENGAGEMENT. Working drawings, details, perspectives, quantities, &c. Good designer and colourist.—Aubrey Pritchard, The Grove, Rhyl, North Wales. 2232

ARCHITECT'S JUNIOR ASSISTANT desires RE-ENGAGEMENT in a good London office: 6 years' experience; good references; salary moderate.—B. E. Atkinson, Junr., 14, Rosslyn Hill, Hampstead, N.W. 2245

ARCHITECT'S JUNIOR ASSISTANT requires ENGAGEMENT. Neat draughtsman, tracer, colourist, &c. Specimens submitted. When writing state salary offered.—Apply J.E.T., 24, Ashbourne Road, Mitcham, Surrey. 2227

ARCHITECT'S ASSISTANT; 12 yrs.' experience, 3 in building; general drawings, perspectives, surveys, levelling, quantities, accounts, supervision; ex. refs.; mod. salary; temporary or permanent.—Box 2261, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S ASSISTANT (21), served 5 yrs. in country, wants SITUATION in London office; salary optional.—C. G. Cowlishaw, Friars Wood House, Newcastle, Staffs. 2256

ARCHITECTURAL ASSISTANT; age 25; details: working drawings, drainage, specifications, perspective, etc.; salary, £2 10s.—F. W. L., 22, St. James' Square, Notting Hill, W. 2258

ARCHITECT and SURVEYOR'S ASSISTANT, with 11 years' provincial and London experience, shortly disengaged, DESIRES BERTH; salary moderate.—Surveyor, 6, Walcot Parade, Bath. 2267

ARCHITECT'S and SURVEYOR'S ASSISTANT (20); working drawings from rough sketches, details, land surveying, quantities, typewriting; 3 building construction certificates; salary, 22s.—H.L.M., 5, Winton Street, Ryde, I. of W. 2266

ASSISTANT (27), 12 years' first-class experience; passed final R.I.B.A.; design working, drawings, details, perspectives, specifications, supervision, quantities and general office work; salary very mod.—B., 85, Durham Road, East Finchley. 2223

ARCHITECT'S AND SURVEYOR'S ASSISTANT (22) DISENGAGED. Student R.I.B.A.; 6 yrs.' experience; working drawings, details, perspectives, specifications, surveys, quantities,; first. class testimonials; moderate salary.—Helm, Victoria Road, Woolston, Hants. 2283

ARCHITECT'S ASSISTANT desires RE-ENGAGEMENT, 6½ years' varied experience; construction certificates; design, details, specifications, surveys, &c.; good references.—W.C.S., 90, Antill Road, South Tottenham, N. 2279

ARCHITECT'S JUNIOR ASSISTANT desires ENGAGEMENT, Edinburgh or Glasgow perferred; five years' experience; good draughtsman; designs, working drawings, perspectives, surveying and levelling, &c.; moderate salary.—Andrew H. Balfour, 23, Abercorn Terrace, Portobello, N.B. 2281

A.R.I.B.A. desires CHANGE OF SITUATION, either temporary or permanent; eight years' experience: designs, working drawings, details, perspectives, quantities, specifications, surveys, levels, &c.; 24 years of age.—Box 2280, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C. 2280

BUILDERS' MANAGER or FOREMAN, capable of interviewing clients, measuring, estimating, setting out, and general supervision of outside jobs: last situation 9 years (London). Carpenter by trade.—Box 2192, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

BUILDER'S ASSISTANT, age 33, seeks SITUATION; nineteen years' experience; well up in the various branches: first class references. —Address, Box 2208, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

BUILDER'S ASSISTANT or GENERAL FOREMAN, builder's son, 12 years' experience, desires a SITUATION; well up in levelling, plans, measuring-up and setting out work (new and alterations), taking out quantities, timekeeping, and general builders' work.—Address B. R. Moore, Sunny Bank, Cold Harbour, Sherborne, Dorset. 2254

BUILDER'S SON (22) desires ENGAGEMENT in Liverpool or district; 8 years' experience; good draughtsman; also certified in building construction.—Apply Box 2282, Builders' Journal Office, 6, Great New Street, Fetter Lade, E.C.

CLERK of WORKS or GENERAL FOREMAN (Carpenter and Joiner), large and varied experience, practical in all branches, well up in plans, &c. Recently completed large industrial development as clerk of works; age 38.—Box 2246, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

CLERK OF WORKS desires ENGAGEMENT; past experiences: library, theatre, almshouses, factories, furnaces, steam boilers, heating, electric lighting, hydrants and sprinklers.—G. R., 17, Sweet Briar Walk, Upper Edmonton, N. 2213

CLERK of WORKS wants RE-ENGAGEMENT. Town or Country. Experienced and practical. First-class references from London and country architects.—F. B. S., 17, Southborough Road, South Hackney, London, N.E. 2242

CARPENTER, JOINER wants JOB. Bench, fixing or jobbing, or will take piecework any quantity; labour only; good testimonials.—H., 86, Alderney Street, Pimlico, S.W. 2225

CLERK OF WORKS or GENERAL FOREMAN seeks RE-ENGAGEMENT, town, country or abroad; thoroughly experienced home and abroad; good testimonials; age 35.—P. G., 428, Uxbridge Road, W. 2224

ESTIMATOR'S ASSISTANT (22), DISENGAGED; quick and reliable at figures; abstracting and accounts; used to large works, also time, wages, and general routine; good references.—A., 100, Hamilton Road, Wimbledon. 2230

GENERAL WORKING FOREMAN seeks RE-ENGAGEMENT. Trade Carpenter and Joiner; age 33; abstainer; reliable; 6 years' good references.—A C. Smith, 86, Brunswick Road, Leyton. 2244

GENERAL or WORKING FOREMAN DISENGAGED. In London or country. Twenty years' practical experience in new building and alterations. Trade, bricklayer. Age 43. Good references from last employers.—H.C., 5, Westbury Road, Paddington. 2226

GENERAL FOREMAN DISENGAGED; trade, bricklayer; age 30, and life abstainer; 5 years with present firm; large experience in Church work; a good detail draughtsman and manager of men; excellent references.—Address B. T. A., care of Byhurst, 2, The Parade, Chiswick Lane, London, W. 2253

GENERAL or WORKING FOREMAN (carpenter); new or alterations, town or country; practical experience all branches; good manager and timekeeper; moderate wage.—W., 29, Pollock Road, Walworth, S E. 2263

MANAGER or GENERAL FOREMAN seeks ENGAGEMENT; thoroughly practical; drawings, quantities, estimates and supervision; excellent references; terms moderate.—J. F. S., 67, Leyton Park Road, Leyton. 2255

MACHINIST (22) requires SITUATION. Over and under, circular saw, band saw, thicknessing and morticing machines.—A. H. Thresher, 9, Leith Terrace, Burntwood Lane, Tooting, S.W. 2284

PAINTER (good) requires WORK; young man, age 27; town or country; used to all classes of work; abstainer; state wages.—A.W.P., 19, Chesterfield Gardens, Harringay, Middlesex. 2175

PLUMBING, GAS, HOT WATER.—Wanted piecework, by certificated plumber; first-class builder's reference.—Apply, Plumber, 93, Fulham Palace Road, Hammersmith. 2270

QUANTITY SURVEYOR'S ASSISTANT (22) desires ENGAGEMENT; 6 years' London experience working up and taking off; temporary or otherwise; London or Provinces; salary moderate.—Box 2165, Builders' Journal.

QUANTITY SURVEYOR'S ASSISTANT (21) desires ENGAGEMENT, temporary or permanent, working up and taking off. Excellent references.—Box W., Builder's Journal Office, 6, Great New Street, Fetter Lane, E.C.

TO BUILDERS.—Carcasing, Fixing Stairs, or Joinery WANTED, Piecework, Houses taken right out. Labour only.—G. Bown, 27, Spruce Hill Road, Walthamstow. 2239

WORKING GENERAL FOREMAN seeks SITUATION; trade bricklayer; age 30; good references, abstainer.—Address M. G. C., 25, Jerrard Street, Lewisham, S.E. 2247

Appointments Vacant.

PARISH OF READING.

THE GUARDIANS of the Parish of READING are desirious of APPRENTICING a LAD to either the Plumbing or Carpentry Trades.

Tradesmen can obtain full paticulars on application to the undermentioned.

E. J. W. HUGGINGS, Clerk.
32, Thorn Street, Reading.
December 10th, 1906.

ARTICLED PUPIL.—VACANCY for same in old-established London (W.) Architect and Surveyor's office.—Box 2251, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

TRAVELLER calling on builders; commission paid on receipt of orders; great demand; sells at sight; used by all railway companies.—Sanatorium Air Brick, 58, Denmark Road, Southport. 2259

TRAVELLERS, with connection amongst Architects, Local Government Authorities, and Corporations, are offered excellent side lines in Enamels, Varnishes, Paints, &c. Liberal commission—Box 2156, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

TRAVELLER WANTED with spare time calling on first-class Builders with Patent Cowl on commission.—Apply by letter, "A. G.," Preedy Station Road, Wood Green, N.

Drawings, Tracings &c.

ACCURATE QUANTITIES PREPARED by London Surveyor of experience in shortest possible time; reasonable terms; provincial work undertaken; jobs measured up and settled in town or country.—Surveyor, 2, Minster Rd., London, N.W. 2262

ARCHITECTURAL DRAWINGS, TRACINGS, &c., effectively executed by experienced Draughtsmen; very moderate terms.—Stone & Colquhoun, 6, York Buildings, Adelphi, W.C. 2189

ASSISTANCE rendered in the preparation of Architectural Drawings, &c., at advertiser's own address.—Box 1717, Builders' Journal Office, 6, Great New Street, Fetter Lane, E.C.

DRAWINGS from rough Sketches, Designs, Details, Specifications, Drain Plans and Quantities Prepared; terms moderate.—J. W., 8, Rylett Crescent, Shepherd's Bush, W. 2207

PERSPECTIVES AND ELEVATIONS, Pencil, Ink, Monochrome or Colour. Hart & Coxon, 14, Clifford's Inn, Fleet Street, London, E.C. Established 14 years. Specimens sent.

PERSPECTIVES effectively executed. General architectural drawings; terms from 21s. —Address, Claude H. Simpson, 98, Raby Street, Moss Side, Manchester.

QUANTITIES AND SPECIFICATIONS ESTIMATES. **(Nominal fee if unsuccessful). Experienced General Assistance, Competitions, Designs, Contract, Detail, and Working Drawings—Address, Quantity Surveyors, 21, Liverpool Street, E.C.**

EMPLOYMENT REGISTER.

Too late for Classification.

See p. xxviii *for the Employment Register.*

2279—Architect's Assistant, 6½ yrs.' experience; construction certificates; design, details, specifications, surveyors, etc.; good refs.

2280—A.R.I.B.A. (24) desires change, temporary or permanent; 8 yrs.' exp.; designs, details, working drawings, perspectives. quantities, specifications, surveys, levels, &c.

2281—Architect's Junior Assistant, Edinburgh or Glasgow preferred; 5 yrs.' exp.; good draughtsman, designs, wkg. drawings, perspectives, surveying and levelling; mod, salary.

2282—Builder's Son (22), Liverpool or district; 8 yrs.' exp.; good draughtsman; certified in building construction.

2283—Architect's and Surveyor's Assistant (22); student A.R.I.B.A.; 6 yrs.' exp.; wkg. drawings, details, perspectives, specifications, surveys, quantities; good testimonials; mod. salary.

2284—Machinist (22); over and under, circular saw, band saw, thicknessing and morticing machines.

THE BUILDERS' JOURNAL
AND ARCHITECTURAL ENGINEER.
December 19, 1906.
FIRE SUPPLEMENT (MONTHLY).
Vol. XXIV, No. 619.
6, Great New Street, London, E.C.

NOTABLE FIRES ON THE CONTINENT.

Perhaps the two most interesting fires during the past twelve months have been those known as the Tanners' Hall fire at Paris, and the oil warehouse fire at Bremen. Both are characteristic of the hazards to be met with in large cities owing to inefficient building construction.

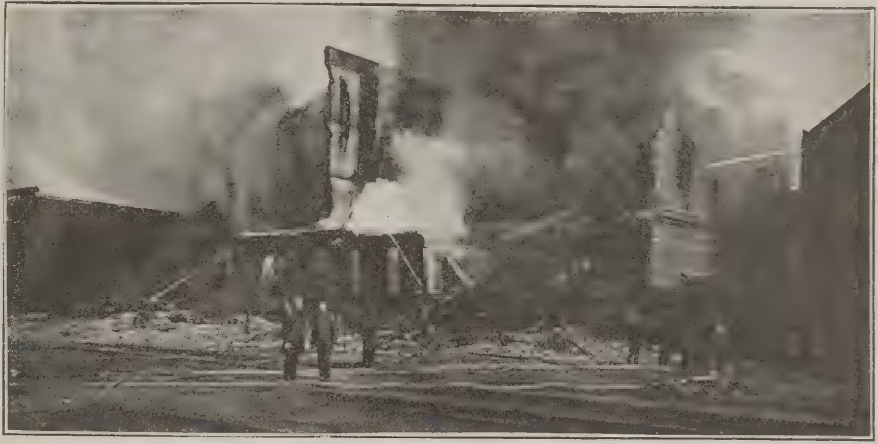
We reproduce a plan and two photographs of the fire at the Bremen oil warehouse with the view of indicating the destruction wrought in buildings of this kind, and one of the views is of particular interest, having been taken actually during the fire. Of the Paris fire we also give a small plan and reproduce two photographs, one of which is a bird's-eye view.

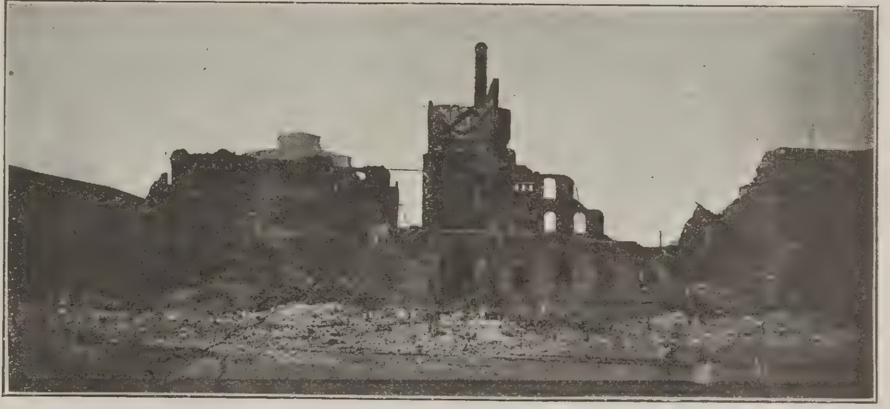
Regarding the Bremen fire, this broke out at half-past four in the morning, and our first photograph showing the destruction of the building was taken at 9.30 a.m., after five hours, the nature of the premises being that of an oil refinery combined with an oil warehouse.

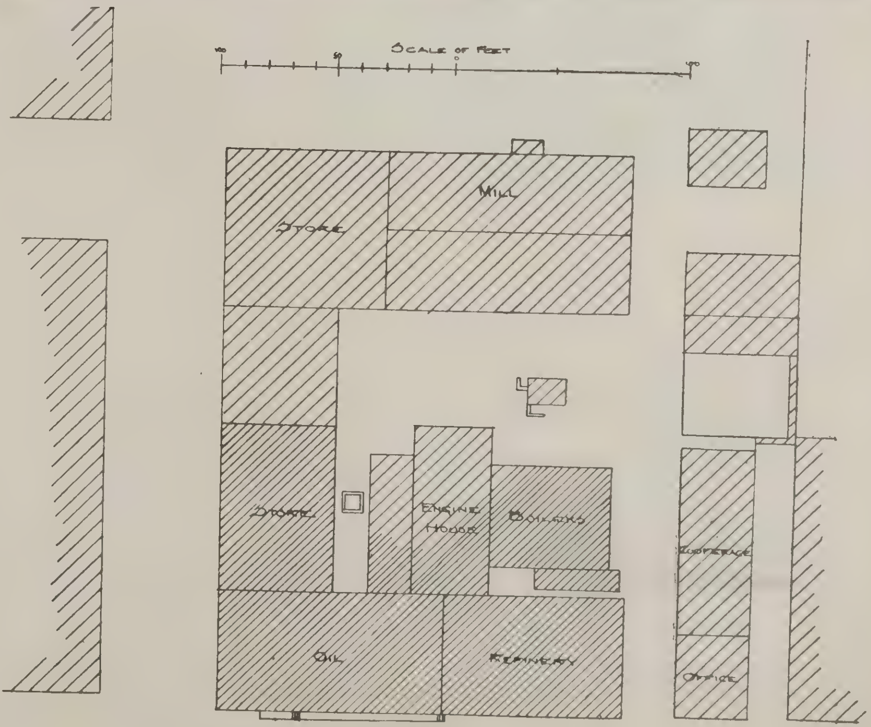
The fire was a peculiar instance of the rapidity with which such a fire spreads, it having been shown that within one and a half minutes of the fire having been noticed quite in a small way, the oil vapour had carried flame to all imaginable ducts and shapes in every part of the building, so that practically the whole place was alight from top to bottom within five minutes of the outbreak, the rapidity of the fire being such that it was with the greatest possible difficulty that the men working in the refinery at the time were even able to make an effort to escape, and, as a matter of fact, two lost their lives.

The nearest fire station was within five hundred yards from the scene of the fire, but owing to the extraordinarily rapid spread and the high temperature reached, the work of the brigade had to be limited entirely to protection of neighbouring property. This policy in itself was of considerable importance, as there were warehouses close by with large and valuable stores, and some eight hundred bales of cotton close at hand on an adjoining wharf actually caught alight. The loss may be taken at £100,000.

Regarding the Paris fire, this took place in a block of buildings which might almost be described as of historical interest so far as construction was concerned, and again owing to the big stores of an oily description there was a most rapid spread of flame, practically the whole of the main building being alight within ten minutes of the fire being noticed. Here the whole effort of the brigade had to be applied to coping with the fire halfway down the block, and in these efforts they were eminently successful.



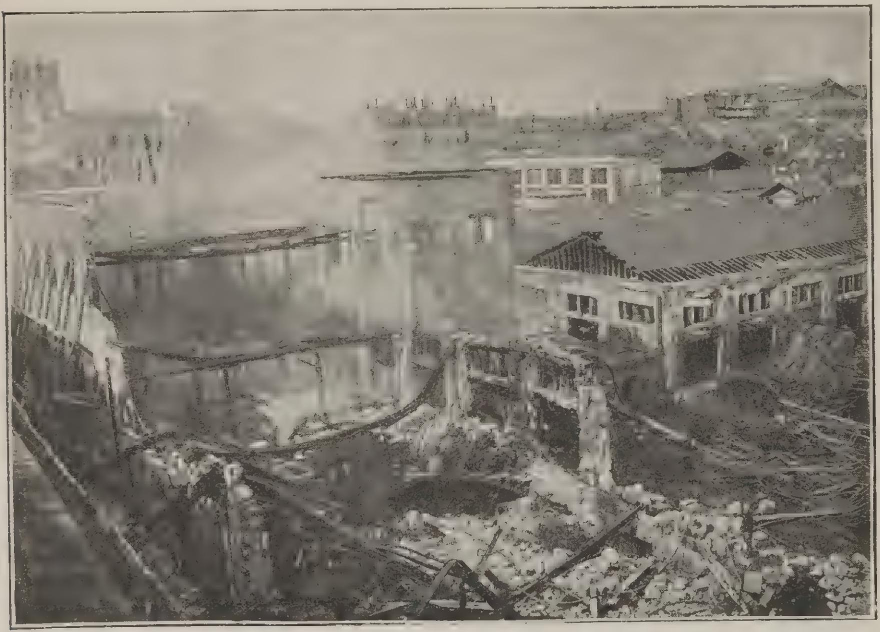


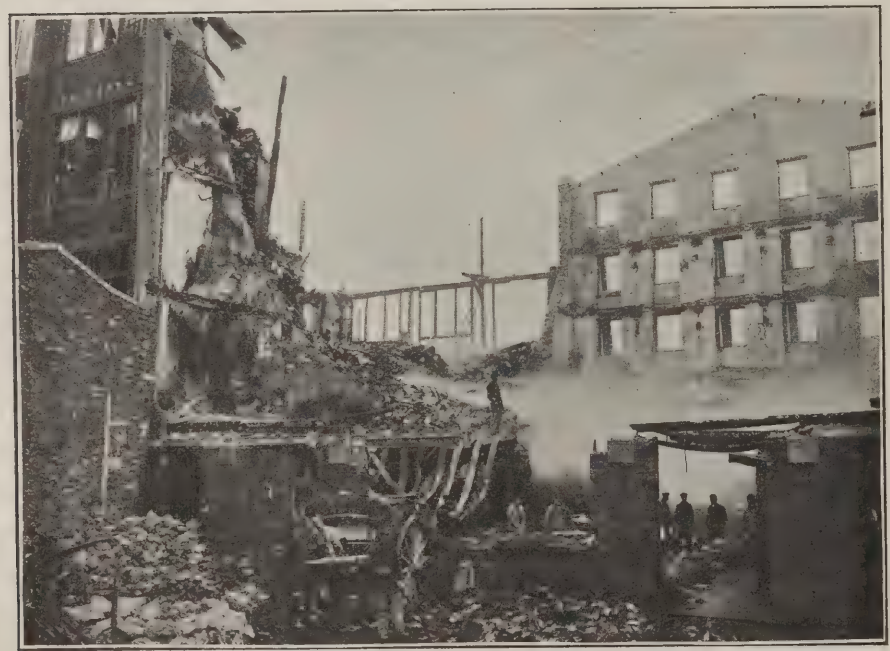


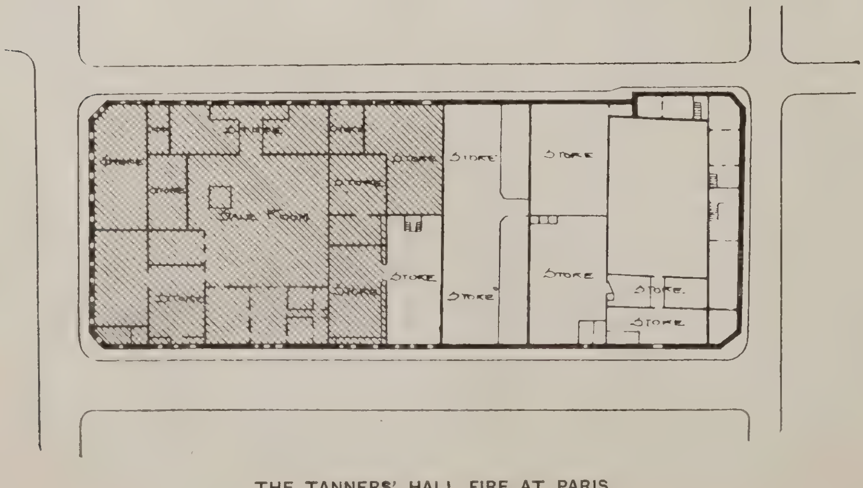
THE OIL WAREHOUSE FIRE AT BREMEN.

Whilst the Bremen fire required thirty-two branches, the Paris fire required thirty-one.

Both fires are object lessons as to the necessity of better sub-division and better construction.







THE TANNERS' HALL FIRE AT PARIS.

THE BOLTON TIMBER YARD FIRE.

The fire which recently occurred at Messrs. J. Cooper & Sons' timber yard and saw mills, Shiffnall Street, Bolton, should serve to draw attention to the need of special precautions that should be observed in the selection of a suitable site for works of this description, where a large amount of dry timber is being stored, and in the employment of some system of fire-resisting construction whereby the danger of the rapid spread of fire is greatly obviated.

It will be seen from the plan given herewith, that these works were surrounded by buildings chiefly of the warehouse class in which are stored cotton waste and other goods of a highly inflammable nature; in addition, another timber yard belonging to Messrs. Cooper is immediately behind, and timber in large quantities is also stacked in the yard of Messrs. Threlfall's works in Shiffnall Street. These surrounding premises were in great danger owing to the strong wind prevailing at the time of the disaster, which caused the fire to spread with such rapidity that in an hour and a half from the commencement the major portion of the works was completely gutted. The direction of the wind is shown by the arrow on the plan.

The fire commenced shortly before midnight on Monday, November 27th, and the alarm was given from the Bolton Corporation tramway sheds, where a number of cleaners were at work; in about a quarter of an hour the brigade was on the spot and quickly got several hoses into play.

The Cause of the Fire.

The exact cause of the fire has not been ascertained, but it is clear that it began close to the spot marked "A" on plan, and probably in the basement. The premises were lit by electricity, the wires being run in wood casings, and possibly short circuiting is to blame; on the other hand, the shavings and dust waste from the saws were kept in the basement at this point, in close proximity to the oil store, and spontaneous combustion may thereby have been generated.

The Damage.

The damage (estimated at £20,000, and covered by insurance) will be seen on reference to the plan. The works consisted of timber yard, saw mills, &c., stores, engine and boiler houses with tall stack, and offices. The latter, together with boiler house, engine house and chimney stack have been saved, the rest of the buildings being completely gutted. The saw mills and workshops consisted of basement, ground and first floors, the remainder of the premises ground and first floors only.

Construction of the Buildings.

The external walls were 18ins. thick at the ground floor piers, with a 4½-in. set-back at window openings, which had brick arches and wood lintels over, and stone sills.

The wooden floorings were carried by strong cast-iron columns, which at intermediate points also carried roof principals; several of the latter remain in position on the Shiffnal Street side, but scarcely any of the general roofing of spars and slates remains.

These premises were built in 1887, a similarly disastrous fire having destroyed the previous premises of the firm.

Lessons of the Fire.

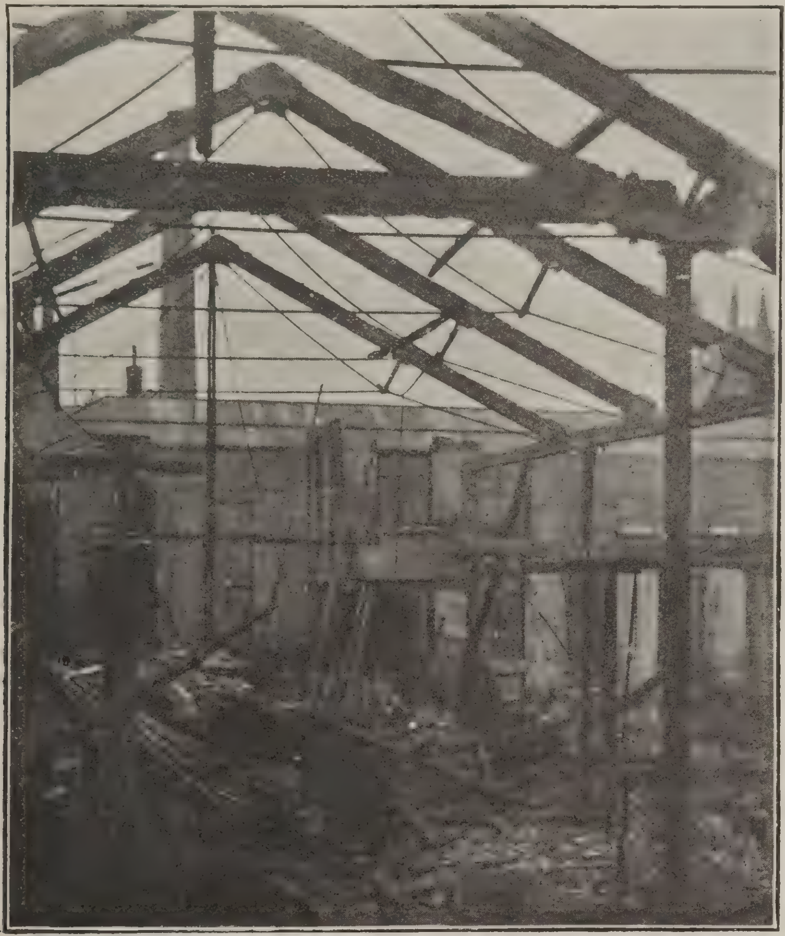
In connection with this fire one point is worthy of special emphasis. In buildings and works such as these, where large open spaces are uninterrupted by cross walls, there is special need of a fire-resisting *roof* for two reasons: firstly, the protection of the structure in case of a fire close at hand; and secondly, the prevention of damage to neighbouring buildings by confining the fire within the premises for a sufficient time. In the present instance large burning pieces of roofing and sparks were blown to a considerable distance, and only the utmost efforts of the firemen and drenching rain prevented a dangerous outbreak.

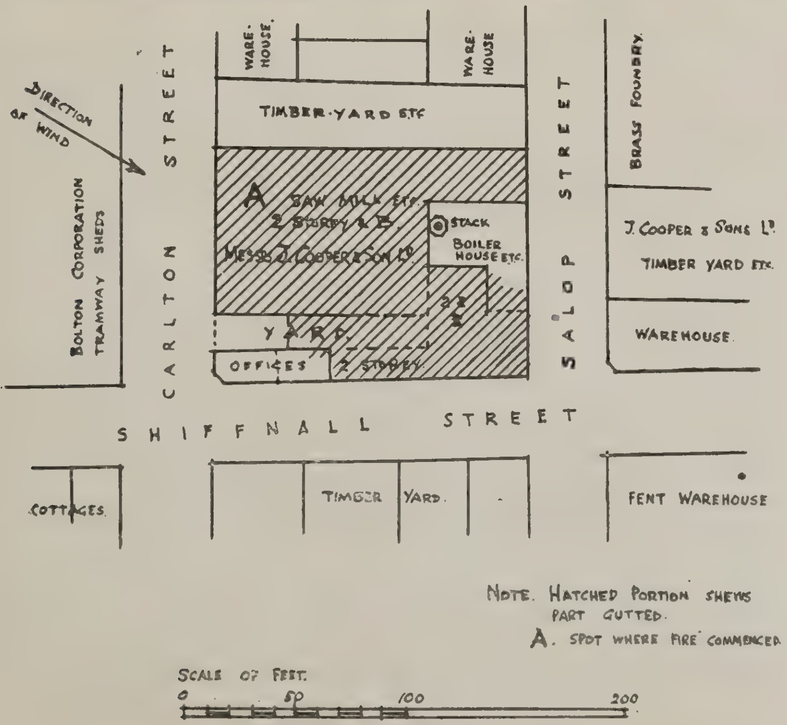
The roof principals used here consisted of wood rafters with cast-iron struts, head and foot boxes, and wrought-iron tie-rods. The latter have been twisted round, and in some cases have pulled the struts and foot boxes from off the rafters by the action of the fire. Where this has been the case the principals have all come down, in several instances bringing the cast iron columns with them. One infers from this that if wooden roofs are bound to be used in cases, let them be wholly of wood and not a combination with iron.

The columns have stood the test fairly well generally, being 11ins. in diameter at the ground floor and having a good thickness of metal, and the temperature not being as high as one would anticipate, yet notwithstanding this, one of the broken ones presents a striking instance of the unreliability of cast-iron columns, and shows how important it is to have them tested before erection. The thickness of metal was found on measurement to vary from 2½ins. to ⅛in. for a considerable distance from the fracture. The core of this column had evidently "floated" in casting.

The principal rafters and many of the larger floor beams and joists have stood remarkably well, as have also the wood lintels over window openings.

Timber merchants, joiners, and others habitually use a great deal of the material with which they are best acquainted in the erection of their workshops, and one is thereby led to hope that some form of wooden fire-resisting or "slow combustion" type of construction, as used abroad and lately illustrated in this journal, will in the future become more general for buildings of this class.





THE BOLTON TIMBER YARD FIRE.

INQUESTS ON FIRES.

Dr. F. J. Waldo, the coroner of the City of London, gave an address on November 21st to the City United Wards Club upon fires and fire inquiries. In Scotland inquiry is made into all fires by the Procurator Fiscal, who conducts a secret inquiry, and has the power to swear witnesses. In England, Ireland and Wales there is no general judicial inquiry into non-fatal fires, except in the City of London, where the coroner, by a local Act, has power of inquiry at his discretion into all fires in the City, whether fatal or otherwise. In ancient times all coroners had this right, which, however, fell into disuse after the reign of Edward I. It remained unquestioned until the year 1860, when in the ruling case of *Queen v. Herford* it was decided that non-fatal fires were outside the coroner's jurisdiction. The power was formally restored to the City of London by Parliament in 1888. There are obvious advantages in the routine inquiry into the cause and origin of fires, such as the detection of crime and prevention of fires. There is some difference of opinion as to the best form of administration. In restoring the procedure to the coroner's court, however, a simple machinery would be ready at hand. The whole question is now under the consideration of the Home Office. One interesting point was that the coroners possessed the function of fire inquiry for upwards of 800 years. Dr. Waldo went fully into the electrical fires that occurred at the Bank Exchange and Oxford Court in 1905, as also into those that took place in the test-rooms at Nos. 57 and 59, London Wall, in 1902 and 1905, and gave his experiences as regards other short-circuit fires examined by him and the City Electrical Engineer. He explained how many practical improvements in exchanges, including the reconstruction of the P.O. Exchange in Carter Lane, had followed on these inquiries.

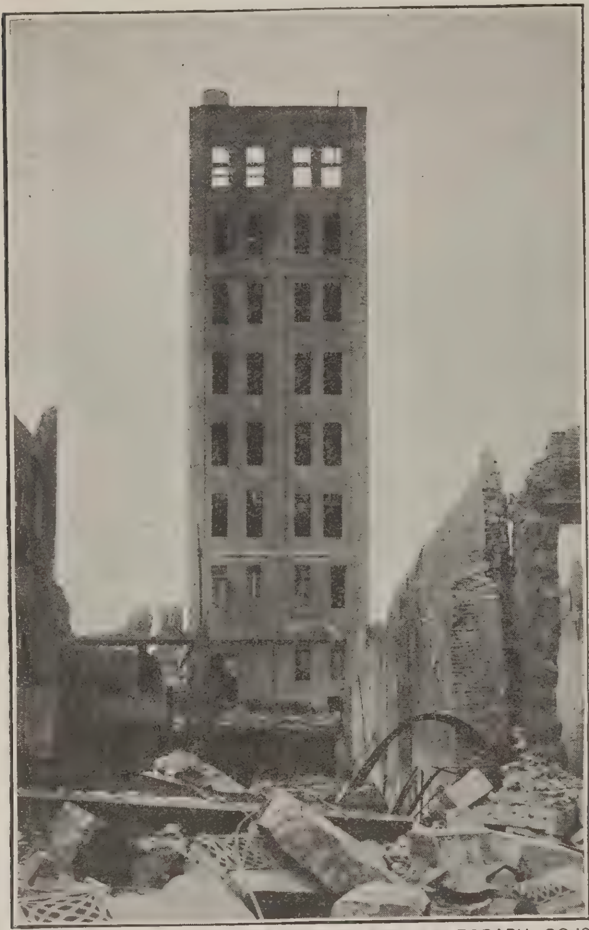


FIG. 1.—PACIFIC STATES TELEPHONE AND TELEGRAPH CO.'S MAIN OFFICE, SAN FRANCISCO: REAR VIEW.

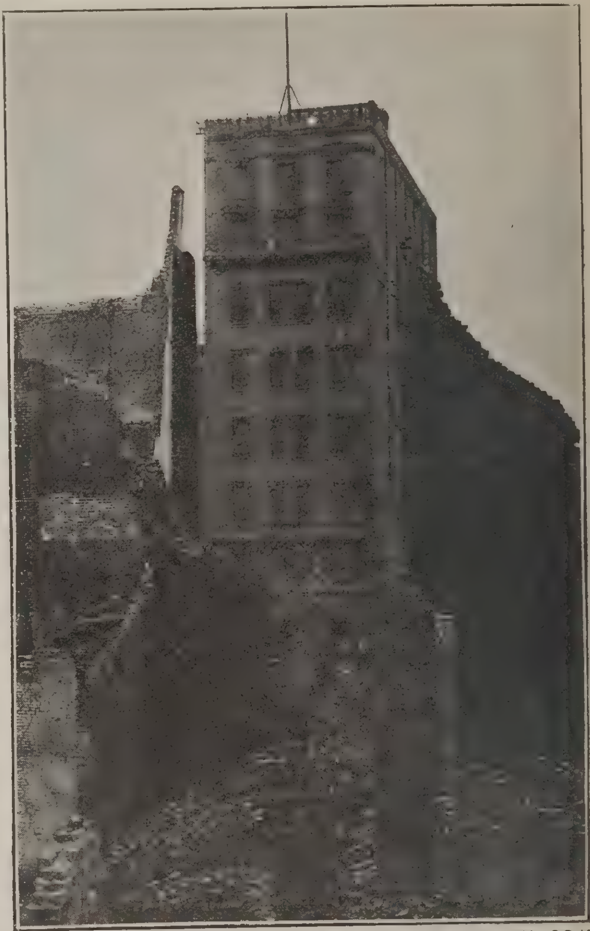

FIG. 3.—PACIFIC STATES TELEPHONE AND TELEGRAPH CO.'S MAIN OFFICE: FRONT VIEW.

PROTECTION OF WALL OPENINGS.

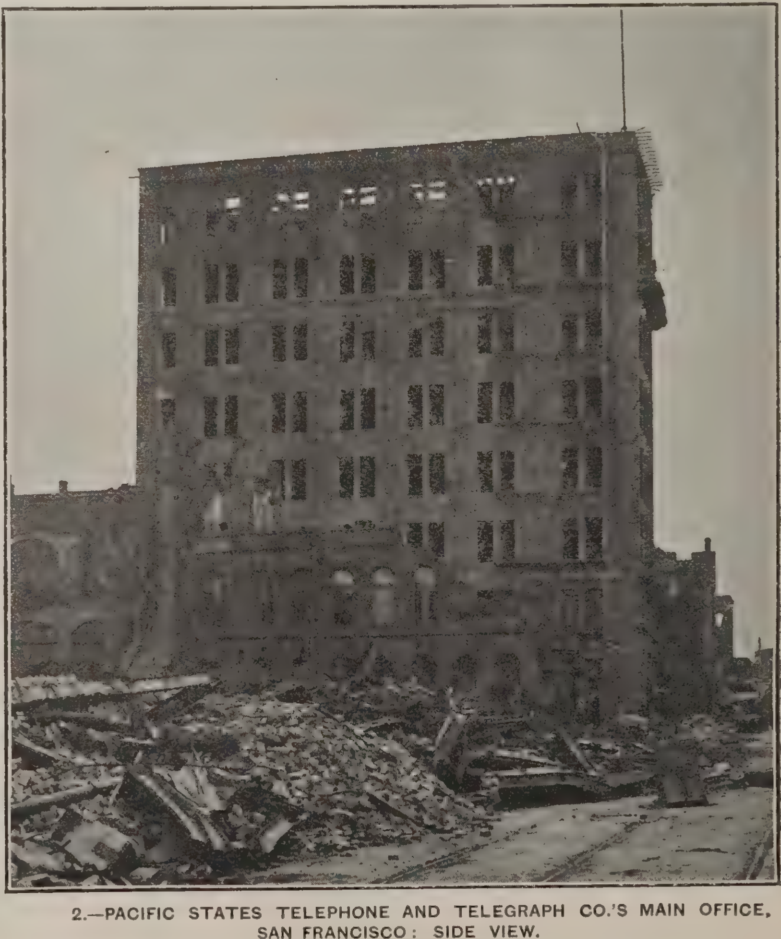
We have had frequent occasion to refer to the efficiency of the Kinnear roller shutters when under test before the British Fire Prevention Committee and also in actual fires. We have now pleasure in adding some additional particulars by way of illustration, thanks to the courtesy of Messrs. Arthur Gibson & Co., who have put some photographs at our disposal taken at the San Francisco fire.

These photographs not only illustrate the efficient service rendered by the roller shutters, but give some interesting general views of certain aspects of the fire.

As we have indicated before, the Kinnear shutters always appear to afford an excellent fire stop, and the only thing which could be improved upon is the question of radiation, which, where single shutters are used, might sometimes result in highly flammable materials on the further side of the shutters catching alight.

In our Fire Supplement for November 21st we published an article on the protection of wall openings by Captain John Stephen Sewell, which deals more particularly with the results of the fire at San Francisco.

In the first column on page 48 Captain Sewell says in his article that in the Bush Street Exchange some of the openings were closed on the outside with rolling shutters made of interlocking corrugated slats, and adds that such a shutter will stop radiant heat for a time, but if it becomes too severe there is danger of the slats warping away from each other, and that the actual impact of flame would almost certainly produce that result. In this he is in error, as is demonstrated by the British Fire Test



2.—PACIFIC STATES TELEPHONE AND TELEGRAPH CO.'S MAIN OFFICE, SAN FRANCISCO: SIDE VIEW.

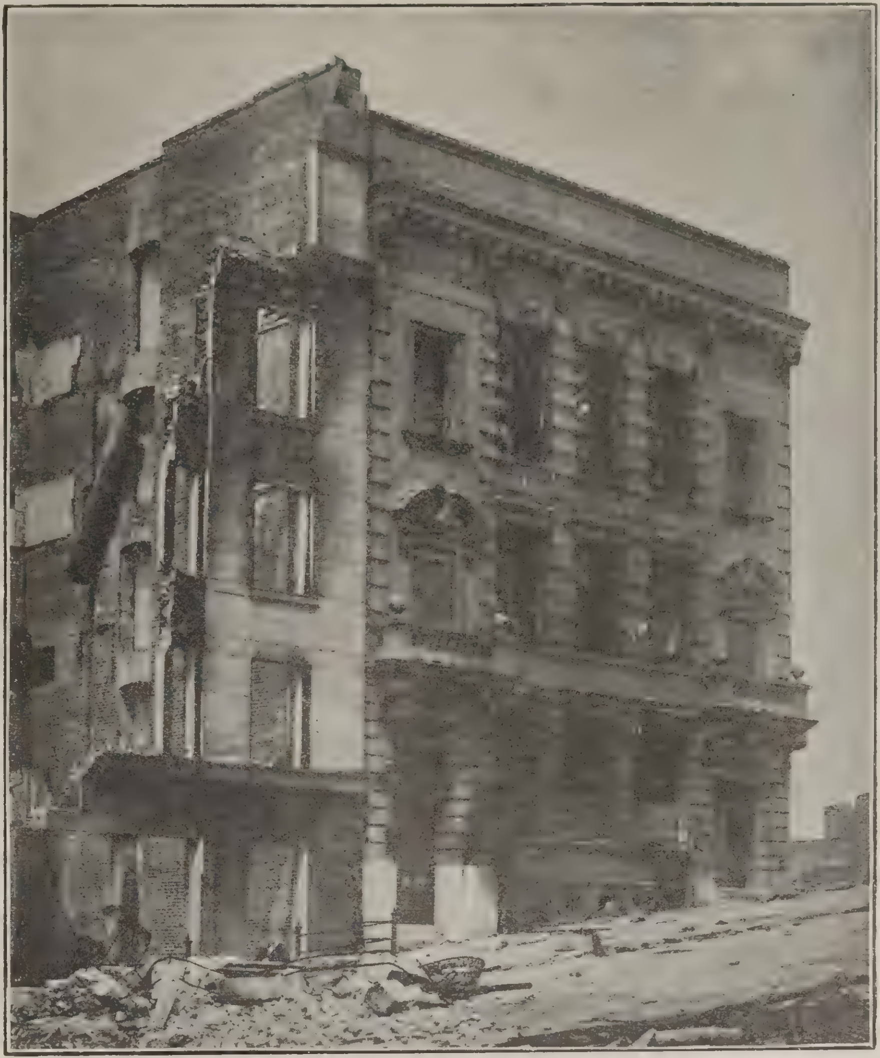


FIG. 5.—AN EXCHANGE OF THE PACIFIC STATES TELEPHONE AND TELEGRAPH CO., SAN FRANCISCO.

No. 113, and previous tests by the British Fire Prevention Committee, of the Kinnear shutters. It is also proved by the actual results in the fire at San Francisco. Captain Sewell is also in error in stating that the best solution may prove to be a continuous flat sheet of steel, or a shutter composed of several such sheets. The continuous sheet would certainly warp out of the grooves, and if the shutter were made up of several telescopic sheets, the sheets would certainly warp apart.

We now draw attention to the accompanying photographs.

Figs. 1, 2, 3 and 4 are views of the main office of the Pacific States Telephone and Telegraph Co. This building was fitted on the rear (Fig. 1) and on the side (Fig. 2) with wired-glass windows in metal frames, and the openings on the side of the building (Fig. 2) were further protected by wood shutters covered with tin, which were concealed in boxes between the brick walls and the wire mesh and plaster coverings.

The openings on the front (Fig. 3) were fitted with Kinnear shutters and ordinary glazed windows with wood frames. The shutters were placed on the inside of the windows. The fire in this building came through the single opening on the ground floor at the rear of the building. This is the opening shown on the left in Fig. 1, and it was the only opening in the building unprotected. The fire having gained an entrance here, was communicated to the various floors by means of the cable well and an opening to the stairway. The building was also exposed to fire on all sides. The wired-glass and metal frames in a great many cases were entirely destroyed, and in the remaining cases were so badly damaged that it was necessary to refit every opening. The same remarks apply to the tin-covered wood shutters.

Figs. 1 and 2 show what a clean sweep was made of all the openings on the side and rear.

The Kinnear shutters on the front were exposed to a high degree of heat, but were not damaged except in one or two cases, where new slats will have to be supplied. In all other cases the only new material required will be the springs inside the rollers.

Fig. 3 shows clearly that all the openings on the front of the building fitted with Kinnear shutters are still closed, and that the front of the building itself received very little damage. All buildings having terra-cotta or stone framing suffered a great deal where the heat and flame had come through the window openings like a blast. The insurance companies stated that about 75 per cent. of the damage to fronts of buildings was due to this cause alone.

Fig. 4 is an interior view of the same building looking towards the front, and shows the Kinnear shutters in position. The walls in this building were covered with angle-iron studding running vertically, on which was stretched wire mesh, and this was finished in plaster. This acted as a protection to the structural frame of the building. The ceilings were made in the same manner. In Fig. 4 it will be noted that light shows through underneath the shutters. This is due to the stone sills having been torn away. On the right-hand shutter it will be noted that light shows through between the grooves or guides and the jamb. This condition existed on several openings, and was due to the fact that the shutters were made from plans, and not from actual measurements. The openings were made somewhat larger than shown on the plans, and as a consequence, it was necessary to fill in between the grooves and jambs with cement, and this cement fell away.

Fig. 5 is a view of an exchange of the same company. This shows the front with three Kinnear shutters at each side.

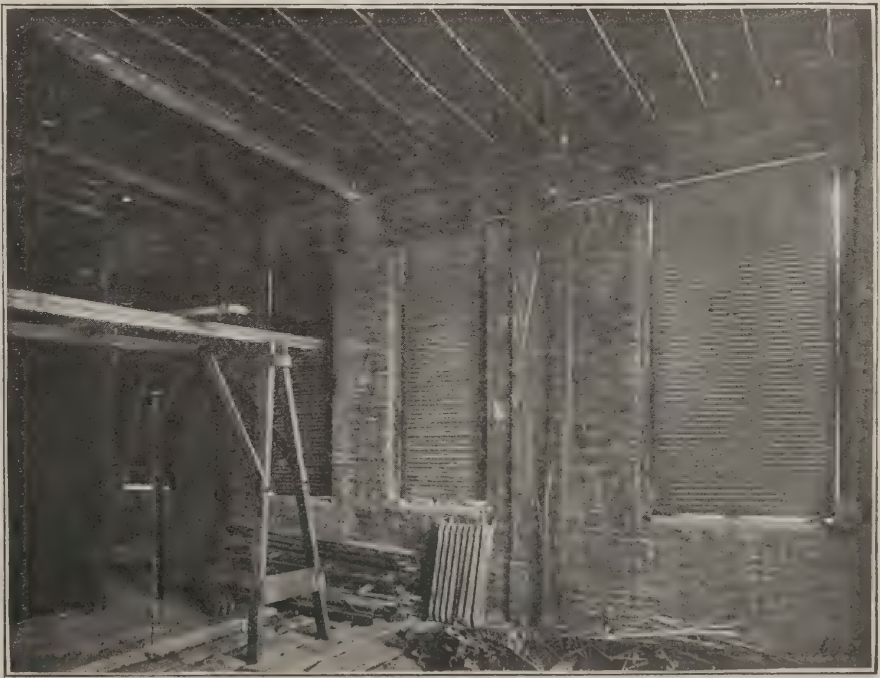

FIG. 4.—PACIFIC STATES TELEPHONE AND TELEGRAPH CO.'S MAIN OFFICE: SHUTTERS ON FRONT FROM INSIDE.

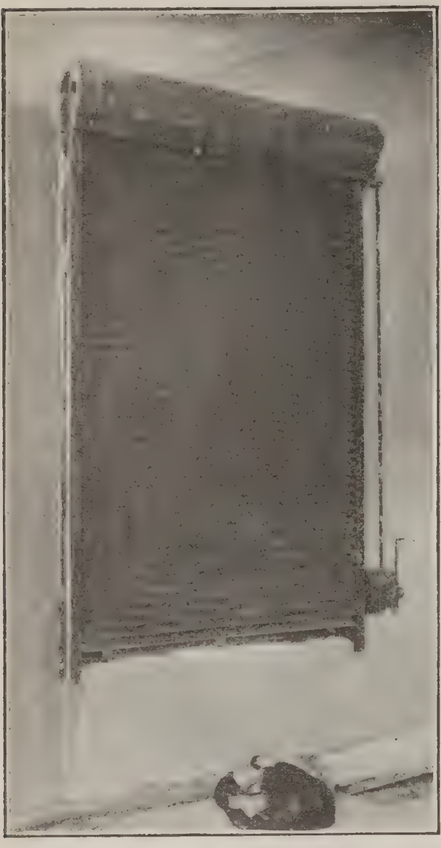

FIG 6.—A SHUTTER ON THE THIRD FLOOR OF THE PACIFIC STATES TELEPHONE AND TELEGRAPH CO.'S EXCHANGE.

The idea in this arrangement, with shutters only at the openings in the extreme sides of the front, was to guard against a lap fire from the adjoining buildings; exposure from across the street was not considered serious, and therefore the three centre openings on each floor were not protected, and the fire entered the building through these large central openings. The rear of this building was fitted with some Kinnear shutters, and some standard shutters—*i.e.*, wood doors covered with tin. The shutters shown on the front of the building (Fig. 5) are all operative and in good condition, except that they require new counterbalance springs. The opening at the right-hand side of the building on the first floor, is in front of the toilet room, the partition wall of which can be seen through the central windows. This room is the only one in the entire building which was not destroyed. Some of the glass in the doors and windows of this room were cracked by the heat and some of the varnish on the woodwork was blistered, but the woodwork did not take fire.

Fig. 6 is a view from the interior of one of the shutters on the third floor. It will be noted that the shutter is in good condition, and that the walls have already been replastered.

Fig. 7 is a rear view of the Volkman Building, and shows three shutters side by side. This building was only partially damaged. The windows were protected by wired-glass and metal frames: these were considerably damaged and will have to be replaced.

ARCHITECTS AND FIRES.

[It is characteristic of current thought in the United States to read articles in "Insurance Engineering" on the question of architects and municipal engineers ignoring the question of fire-resistance. We quote the articles just as they stand, and whilst these, of course, contain exaggerations, there is a certain truth underlying the arguments that both architects and municipal surveyors might well take to heart.]

The Beautiful *v.* the Fire-Resistive.

Most architects and municipal engineers have a happy way of ignoring questions of durability and resistance to fire in building construction, subordinating these and other matters to the question of artistic effects. A recent editorial in the "Municipal Journal and Engineer" says:—

"American cities are earnestly striving after the beautiful, the artistic and the attractive. Everywhere evidences of this can be seen, in public parks, in civic centres, in improvement societies. But with this general demand for the City Beautiful comes an appreciation—by the few, at least—of the lack of men able to advise and plan for the desired results. There are a few specialists in landscape architecture and park designing; a few architects with a genius in the grouping of buildings who can design noble civic centres; a few artists with the brush or chisel who can be relied upon to secure æsthetic effects in the designing and location of fountains, statuary and other decorative appurtenances of a city. But who is to see that all these are not spoiled by numerous hideous blots in the shape of, say, red fire hydrants of ugly outline, stiff and obtrusive poles for supporting lamps and wires, cast-iron abortions of fountains and the like?"

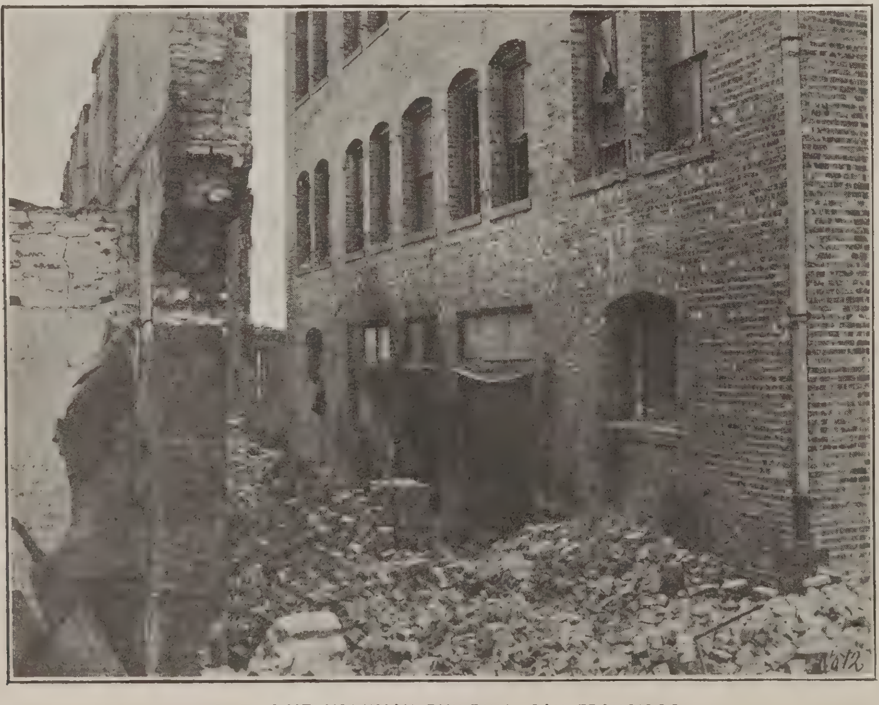

FIG. 7.—THE VOLKMAN BUILDING, SAN FRANCISCO.

Red fire hydrants may be unsightly, but so are ruins of fires. Of the two, fire hydrants are more useful in preserving a city intact than artistic effects in architecture. "The Insurance Press" makes the following comment on the editorial quoted above:—

"The City Beautiful is a fine idea, but, like some other admirable projects, may make haste too rapidly. A more immediate question is the City Fire-resistive.

"In the highest art utility and beauty go together. There is no loftier principle in city building than consideration for the safety of life and property. Fire hydrants are sometimes 'hideous blots.' So are fire escapes. Nothing is much uglier than a tank on a roof. Interiors are spoiled, in the view of art connoisseurs, by the heads of automatic sprinklers. Chemical fire extinguishers and coils of hose are not things of beauty. Few of these things can ever be made lovely to look upon.

"Let us have 'noble civic centres,' 'æsthetic effects' and 'decorative appurtenances' if we can get them without a diminution of safety. But let us yearn for nothing 'beautifying' unless it is substantial and fireproof, or as nearly fireproof as can be secured. What is wanted is the engineer's type of beauty, and not the architect's, unless we can have a happy blending of the two. 'The Insurance Press' votes for safety first, for beauty incidentally."

Improvement of Old Buildings.

A far more serious question is, What shall we do with the hundreds of thousands of old buildings that are filled with defects that favour conflagrations? Again, "Insurance Engineering" quotes from its contemporary, "The Insurance Press," in answering that question:—

"Is it not a significant fact that none of the conflagrations from which this country has suffered started in buildings that even pretended to be fireproof?

"Has not the value of the various simple improvements in building construction recommended by the fire underwriters been lost sight of in the excitement following conflagrations?

"When a fire door, put in on the recommendation of underwriters, prevents the spread of fire, should not the fact be bulletined to the business world as a reminder to business men of the value of such a simple device?

"When a watchman, employed on the recommendation of underwriters, discovers a fire before it has had time to spread and extinguishes it with some approved appliance for the purpose, also suggested by underwriters, should not these facts be heralded to the insuring public?

"If merchants who have followed the recommendations of the underwriters have profited by so doing, why should not other merchants experience the same benefit by following the same example?

"The modern system of schedule rating offers to every man inducements for lessening the chances of a serious fire on his premises. It shows him what certain defects in the construction of his building cost him in insurance premiums, not to mention the uninsured loss that may be caused directly or indirectly by those defects. Briefly, schedule rating shows the property owner how his rate is made by himself and not by the fire insurance companies.

"Much has been said of late years about reducing conflagration dangers. Where is the work to begin to make it effective? Is the future safety of our large cities to depend on the fire-resistive character of *new* buildings? Will not the new buildings be menaced by the old ones that are full of defects which favour spreading fires? Will not the old buildings outnumber for years the new ones whose owners have accepted the lessons of conflagrations?

"Public fire departments and modern apparatus for extinguishing fires will always be indispensable, but they must be helped by making all buildings fire-resistive in certain particulars. 'The Insurance Press' does not advocate reconstruction—that is impossible—but by following the simple and effective remedies of the underwriters for preventing the spread of fire from room to room, from floor to floor and from building to building, a great deal can be accomplished at a comparatively slight cost considering the credits to be secured in insurance rates for these improvements, as well as the almost certain immunity from serious fires.

"There are large numbers of buildings that have been adapted to different occupancies without due regard for the fire hazard. These are among the worst examples of conflagration breeders. They are nether one type of construction nor another. Radical improvements are needed in such structures to make them even reasonably safe."

The Responsibility of Architects.

By F. W. Fitzpatrick.[*]

"Insurance Engineering" has certainly done its share towards elucidating to our people the folly of poor construction, its appalling cost and the various and sundry means that should be taken to *lessen* those losses—to *eradicate* them, doing the best we can, will take at least a generation's time. With the different lessons of our recent great conflagrations still in mind, might it not be well, not in any carping or fault-finding spirit but simply as a curative expedient, for us to ask "Who's to blame?"

The people put up the money for building, they direct in a general way what they want in the matter of space, &c., but, manifestly, they cannot be expected to also direct how building should best be done to prevent its destruction by fire, or in the matter of its sanitation, heating, &c. That is the province of the architect. He is the expert who is supposed to know all about and to control all those details. In the vernacular, it is "up to him." How well he has acquitted himself of the task can best be illustrated by the fact that in all our country there are about 11,500,000 buildings; their value is something like $14,500,000,000, and of all that number there are but 4,000 whose authors even claim as at all fireproof. In most cases that fireproofness is limited solely to the structural or skeleton part of the building. In all else they are about as flimsily constructed as is the most "ordinary" building. Of those 4,000, there is but one building, the Underwriters' Laboratories in Chicago, where all the known methods of fireproofing are assembled under one roof, but *one* absolutely fireproof building in this great country of ours. The others of even the 4,000 are damageable from 20 to 90 per cent. of their cost value.

The Folly of Limited Efforts.

It would seem that the average architects, or even the best of them, believe that by fireproofing the structural steel with hollow tile or with the various substitutes, concrete, &c., &c., some sort of occult transformation takes place and they are relieved by that one act from doing anything else in the fire-proofing line. If you don't think that that is so glance at the illustrations and the several reports of the San Francisco fire. Had $10,000,000 more been spent originally on the buildings of that city, it would have meant the saving of at least $100,000,000 in the conflagration; or, to be more specific, if the architects of the thirty-five so-called fireproof buildings had exercised judgment enough to have spent $600,000 more on their construction, or rather shifted that amount from wonderful ornaments and fine marbles to the greater essentials of fire-prevention, they would have saved those buildings intact, buildings in which at least $9,000,000 destruction has been wrought. Simpler still, had the single precaution been taken of protecting the windows of those buildings, an additional expenditure or a shifting of not over $60,000, from frivolous ornamentation to that necessity, the interiors and contents of those buildings would have been intact to-day!

With those facts clearly before me and a long list of others, the accumulation of twenty-odd years' most intimate association with the practitioners, there is enough to justify me in the claim that our architects show lack of skill, if not actual stupidity or criminal negligence, in planning their buildings. I suppose this sounds like *lèse majesté*, or treason, or something of that sort, but the facts are there, and the sooner someone brings them forcibly to popular attention the sooner may we expect that conditions will be ameliorated.

The architects' training is somewhat against them. Their earliest lessons are in the artistic line and all too often the schools, the older practitioners and all the influences surrounding the youngsters conspire to give them a haughty disregard of things merely practical. Let the bids on any building come to more than the owner intends spending and watch the architect pare down to get within the limit. He will cut off the fireproofing even of the steel, he will rip out the very bowels of that building if he can only preserve what he deems to be his beautiful exterior intact and certain mantels and other little internal fussiness. He forgets that real beauty is Truth and that the very first purpose of any building is to have its interior adapted to the business for which it was built, its exterior merely clothing that interior, permanent and undamageable by the elements, and then what is left of the money used for a chaste adornment or ornament of the exterior or of the interior.

The Jealousies of Specialists.

Our civilisation has grown very complex and with alarming rapidity, and our architects have not kept up with the progress. To put it plainly, the job of building has become too big for nine-tenths of them, and the other tenth, who know more than their confrères, are generally too busy in the "executive functions" of the profession, committees, dinners, social functions, the getting of large commissions, &c., &c., rather than paying attention to details, so that the world is really not over-much benefited by their versatility.

True, the structural engineer has been brought into requisition and also the heating expert, the sanitary man and so on, as auxiliaries, aids to the architects. But each one makes the mistake of believing that *his* profession is the leading one and that all else should be subservient to it. He is jealous of everyone else and the architect, the executive officer, has a dickens of a time reconciling these various experts, adjusting their squabbles. One would think that the structural engineer's province would be to help out the architect in a general system of fireproof construction, but, bless you, he himself knows mighty little about it. He is long on learned dissertations about the modulus of elasticity in concrete, he can beautifully arrange the riveting of his columns and girders and adjust to a hair's breadth the factor of safety, he knows how to figure out reinforced concrete—particularly the one hundred and twenty-seventh patented system, his own—so that there will be less cement and far greater strength than in any other system, but he will never advise the architect to close his stairs and elevators, to make smaller his units of space, to protect his windows, or anything of that sort. He brushes all that aside; it is not engineering to him.

The Function of the Insurance Engineer.

It resolves itself into this, that if the architects themselves don't know enough—and they certainly have not shown any wonderful acumen in the matter heretofore—about fire-prevention to properly devise and plan and construct their buildings, and are too jealous of their own high prerogatives and supposed all-covering knowledge to call in an expert who *does* know how to adjust and connect all the branches of building so that one does not vitiate the other, then it is clearly "up to" the owners of projected buildings to take the matter into their own hands and have their plans passed upon by a real fire expert, such as Mr. Reed of the Committee of Twenty, for instance, before they begin actual operations. These operations frequently consist, so to speak, in figuratively shoving hundreds of thousands of dollars into a rathole. Business men take the very greatest precautions before going into ordinary business deals. If it is real estate, they have the titles examined and everything done up in excellent form; if the law, they carefully select their attorney, and he must be a man who knows all about that special kind of litigation and has made a success of it. When it comes to building, a transaction that involves oftentimes a hundred-fold as much as his other deals, he will confide himself body and soul, as it were, to a young cousin of his wife's, to the protégé of some friend or other more or less unknown, and, very possibly, incompetent fellow, whose principal equipment in a professional way is the sign over his door, "Architect." The result is that fire costs us, for smoke, fire departments, money wasted in insurance, &c., a sum equal to 5 per cent. yearly on $10,000,000,000! In other words, that sum might be termed the amount we have invested in stupidity!

---

[*] Consulting Architect, Washington.

What the Future Promises.

Under proper direction, in a generation's time or so, if most of our flimsy buildings have been destroyed and a better class built, really full-fledged fireproof construction, with its attendant increased first outlay, will not be so necessary. In a town where all the buildings are simply incombustible, the precautions we have to take now to make a building fire-resisting will not be needed. There is so much inflammable all about us, fire and conflagration hazards are so great, so ever present, that the very top-notch of precautions have to be taken with the buildings that are built now, whose owners have any desire to preserve them. It is a condition that has been brought about by our own folly, or, to be more specific, our architects' rank incompetency. We have to face that condition, and for a time go to an extraordinary expense and exercise the utmost care to make our buildings superlatively fire-resisting. The architect has not done so heretofore; that he will or can do so hereafter is a matter of conjecture. Engineers, nine out of ten of them, are purely and solely structural specialists. The fire experts are few and far between, and the chances are that the great bulk of our people will have to be satisfied with insisting upon their architects complying with the generalities of the art of fireproof construction, as set forth in "Insurance Engineering" and the other technical journals that really give any attention to that most important subject.

If a man desires to learn another language than his own the proper caper is to get a teacher who knows that language thoroughly, the country, its customs and all about it; if he cannot afford that, then he can at least get a smattering, a dab at that language, perhaps enough to keep him from being led astray in that strange land if he visits it, by studying "French at a Glance" or some of those many other text books that are indeed most helpful. A little knowledge of a subject, some very ancient authorities to the contrary notwithstanding, is infinitely better than absolute ignorance thereupon. It will at least show one how much more there is to be known and perhaps give him a proper appreciation of how very little he does know, and an incentive, a willingness, to acquire more if it is at all gettable.

Door and Window Openings.—At the Birmingham Insurance Institute an important paper was read this month by Mr. Ellis Marsland, district surveyor of Camberwell, who, at the invitation of the Institute, discussed his various methods of protecting door and window openings from fire. Mr. Marsland's paper was illustrated by a fine collection of lantern slides, showing photographs taken at the tests of the British Fire Prevention Committee, and from actual fire ruins.

PROTECTION AGAINST FIRE FROM LIGHTNING.

We have heard so much of what our own Lightning Research Committee considered to be advisable with a view to safe-guarding buildings against lightning that it should be of interest to observe what is considered advisable in the United States by those who are more or less directly interested in fire protection—namely, the members of the National Fire Protection Association, many of whom have considerable fire insurance experience.

We therefore reproduce the latest specification recommended by the National Fire Protection Association for the protection of buildings against lightning, and we should welcome correspondence on this subject, the importance of which is still quite underrated in this country.

Suggestions for Protection of Buildings against Lightning.

1. —Note.—Protection against lightning is advisable on country buildings, on isolated buildings, and on all buildings wherever located having elevated features such as tall chimneys, steeples, high peaked or gable roofs and flag poles. Since complete protection of any building will depend largely upon its location, size, shape, construction and nature of the occupancy, definite requirements cannot be laid down for the installation of lightning conductors, but the following general suggestions should give, under most conditions, reasonable protection:—

2.—*General Suggestions for Installation.*

(*a*) One rod with proper air and earth terminal is recommended for unit of ground area as follows:

Flat or peaked roofs of metal, one for each 3,600 sq. ft. of ground area.

Flat or peaked roofs other than metal, one for each 1,600 sq. ft. of ground area.

Note 1.—Air terminals should never be more than 50ft. apart. Ordinary type flat or peaked metal roof approximately 60 by 60ft. ground area or same type other than metal, approximately 40 by 40ft. ground area, will require one rod and earth terminal, but sharp corners wet with rain, such as gables, dormers and wings, diminish resistance and may require protection in greater proportion to area.

Note 2.—A low, broad building of greater area than 75 by 100ft. can best be protected by an additional rod through the centre of the building.

(*b*) The air terminal to be placed at the highest point of the roof or structure. Where there are two or more gables or other projections above the roof of equal or nearly equal height. each to have an air terminal, and all to be bonded together over the high part of the roof to make the system a unit.

Note 3.—More than one air terminal can be connected with the same ground by the regular conductor, provided other conditions in these rules are not violated. See Rule 5 (*a*).

(*c*) All exterior metal work to be connected with the lightning rod system below the line of the metal itself or be separately grounded by regular conductor. This includes metal roofs, gutters, ventilators, railings, chimney hoods and stacks.

(*d*) All interior masses of metal, such as girders, beams, water piping and any structural iron or steel, but under no consideration gas piping, to be securely connected to the system at their highest and lowest points, the connecting bonds being the regular conductor. It should be borne in mind that conductors and bonds throughout their entire course should always incline downward.

Note 4.—Where a building contains gas piping, the iron pipe on both sides of the gas meter to be securely bonded around the meter by conductor, being careful to make secure electrical connections between the pipe and bond. See Rule 6 (*a*).

(*e*) Where trees stand so close to a building that branches overhang or approach very close to the roof, a conductor with proper earth terminal to extend along the trunk of each tree to near the highest branch top, fastened by a band around the branch or trunk and equipped with a cluster of points. If extreme protection in such cases is desired, wires may be strung from tree to tree across the roof of a building, with sufficient slack to permit of trees swaying, and all connected together. In either case the building should also be equipped with proper lightning rod.

Note 5.—If wires are strung across a building from tree to tree they should not be smaller than No. 6 B. & S.

3.—*Materials.*

(*a*) Conductors may be made of soft copper in either sheet or tape form, or in form of stranded cable, weighing in each form not less than 6 ounces per foot. Where cable form is used no single copper wire to be less than No. 12 B. & S.

Note.—One inch iron rod can be used to connect iron ground with copper conductor, the conductor terminating above the surface of the ground.

(*b*) Conductors may be made of iron in either sheet or tape form, or in cross section, representing "star" shape, weighing in each form not less than 2¼lbs. per foot. Iron, when used in any form, must be thoroughly galvanised to prevent corrosion, and may be also painted, if desired.

4.—*Air Terminals.*

(*a*) To be rods of iron or copper not less than ¾in. in diameter, with point cone-shaped, and height of cone equal to the radius of the base.

(*b*) One foot below the point there should be a casting holding four copper points, each 6ins. long and ¼in. in diameter, or a group of points may be placed on the end of the terminal.

(*c*) Large chimneys should have a band of copper or iron not smaller than the conductor around the top below the corbeling, with terminals securely attached thereto extending 3ft. above the chimney. The terminals to be placed at intervals of not exceeding 4ft. along the circumference of the chimney; each terminal to be connected individually with the band around the chimney.

(*d*) All metal chimneys or stacks to be thoroughly grounded.

(*e*) Terminals should extend not less than 3ft. above flat or peaked roofs or chimneys, and be firmly secured in an upright position.

5.—*Conductors between Air Terminals and Ground.*

(*a*) All joints to be made mechanically and electrically secure, and then soldered.

(*b*) To be run down side of building where best ground is obtainable, preferably on the side most exposed to rain.

(*c*) Not to be run nearer than 5ft. to interior piping unless absolutely unavoidable.

(*d*) To be run as straight as possible, avoiding all turns of radius less than 1ft., and to incline downward throughout its entire course.

(*e*) In case of a chimney other than iron, 50ft. high, two conductors on opposite sides should be provided. Where a chimney is in excess of 50ft. in height an additional conductor should be provided for each additional 50ft. or fraction thereof, spacing the conductors at equal intervals around the circumference of the chimney.

Note.—Added protection can be secured by providing extra bands around the chimney at intervals of 25 to 50ft., all such bands to be securely connected to all conductors.

(*f*) Should never be insulated, but fastened securely to the surface to be protected by clamps of same kind of metal and of sufficient strength in mechanical application to prevent conductors from working loose, at the same time allowing for expansion of the metal.

(*g*) Must never run through iron pipes.

6.—*Connections.*

(*a*) With iron piping or castings, preferably to be made by screwing a brass plug into same and fastening conductors securely to it, then soldering. Another method is by using a soft clamp having a cross section of not less than ¼in. by 1in., which will securely grip the pipe by means of tightening a machine screw or bolt not smaller than ¼in. in diameter. The conductor to be soldered to a lug in this device.

(*b*) With copper ground, by riveting and soldering, the connection then being coated with asphaltum paint.

7.—*Grounding on Earth Terminals.*

(*a*) A copper plate, not less than 2ft. by 3ft. by 1-16in. buried in permanently damp earth below the frost line and not less than 4ft. below the surface, with 3ins. of crushed coke or charcoal underneath, and the same material above to within 6ins. of the surface of the ground.

(*b*) An iron casting, so shaped as to have a number of pockets or cups facing upward, should have not less than 6 sq. ft. of surface. Should be buried in not less than 6ins. of scrap metal and coke under, and 6ins. over same.

(c) A third method of grounding, which may be used if neither of the above is possible, is to dig a trench not less than 3ft. long and 1ft. wide, leading away from the building and deep enough to reach permanently damp earth, but not less than 4ft. deep, and cover the bottom with a layer of scrap metal or well burned coke, about walnut size, in which a "star"-shaped casting securely attached to conductor shall be embedded.

(*d*) Another very satisfactory method of grounding is to connect the earth terminals with municipal water pipes, and where such connections are permissible, connection can be made as specified under No. 6, by connecting into the bell at the joints or where piping is wrought iron, by the clamp, as specified.

(*e*) An iron pipe not less than 10ft. long, 2ins. inside diameter and ¼in. thick, perforated with ½in. holes at intervals of 3 or 4ins., or with slots ¼in. by 10ins. at intervals of 10ins. A hole must be dug 10ft. deep and not less than 6ins. in diameter, the pipe placed in the centre and the hole filled in with crushed coke or charcoal about pea size.

Note.—A proper ground is absolutely essential and permanently damp earth is absolutely required. If same cannot be found at base of conductors, they should be extended underground (buried below the frost line in a wooden jacket) to a point where proper ground can be found. Where 1-in. iron rod is used to connect conductor and ground, same need not be encased in a wooden jacket.

THE BUILDERS' JOURNAL
AND ARCHITECTURAL ENGINEER.

December 26, 1906.
Volume 24, No. 620.

NOTICES.

Offices: 6, Great New Street, Fetter Lane, London, E.C.

Telegraphic Address: "Buildable, London."

Telephone Numbers: 2200 Holborn, 2201 Holborn, 2202 Holborn and 2203 Holborn.

Date of Publication: The Builders' Journal and Architectural Engineer is published every Wednesday, price 2d.

A Special Supplement is regularly presented free with the ordinary issue, three weeks out of every four. These three regular monthly supplements are entitled "Contractors' Supplement," "Concrete and Steel Supplement," and "Fire Supplement" respectively.

The Subscription Rates per annum are as follows:—

At all newsagents' and bookstalls	8s. 8d.
By post in the United Kingdom	10s. 10d.
By post to all places abroad	17s. 4d.

All Accounts are payable to Technical Journals (1902), Ltd. Cheques should be crossed "London and Westminster Bank, Temple Bar Branch." Post Office Orders should be made payable at Fleet Street, E.C.

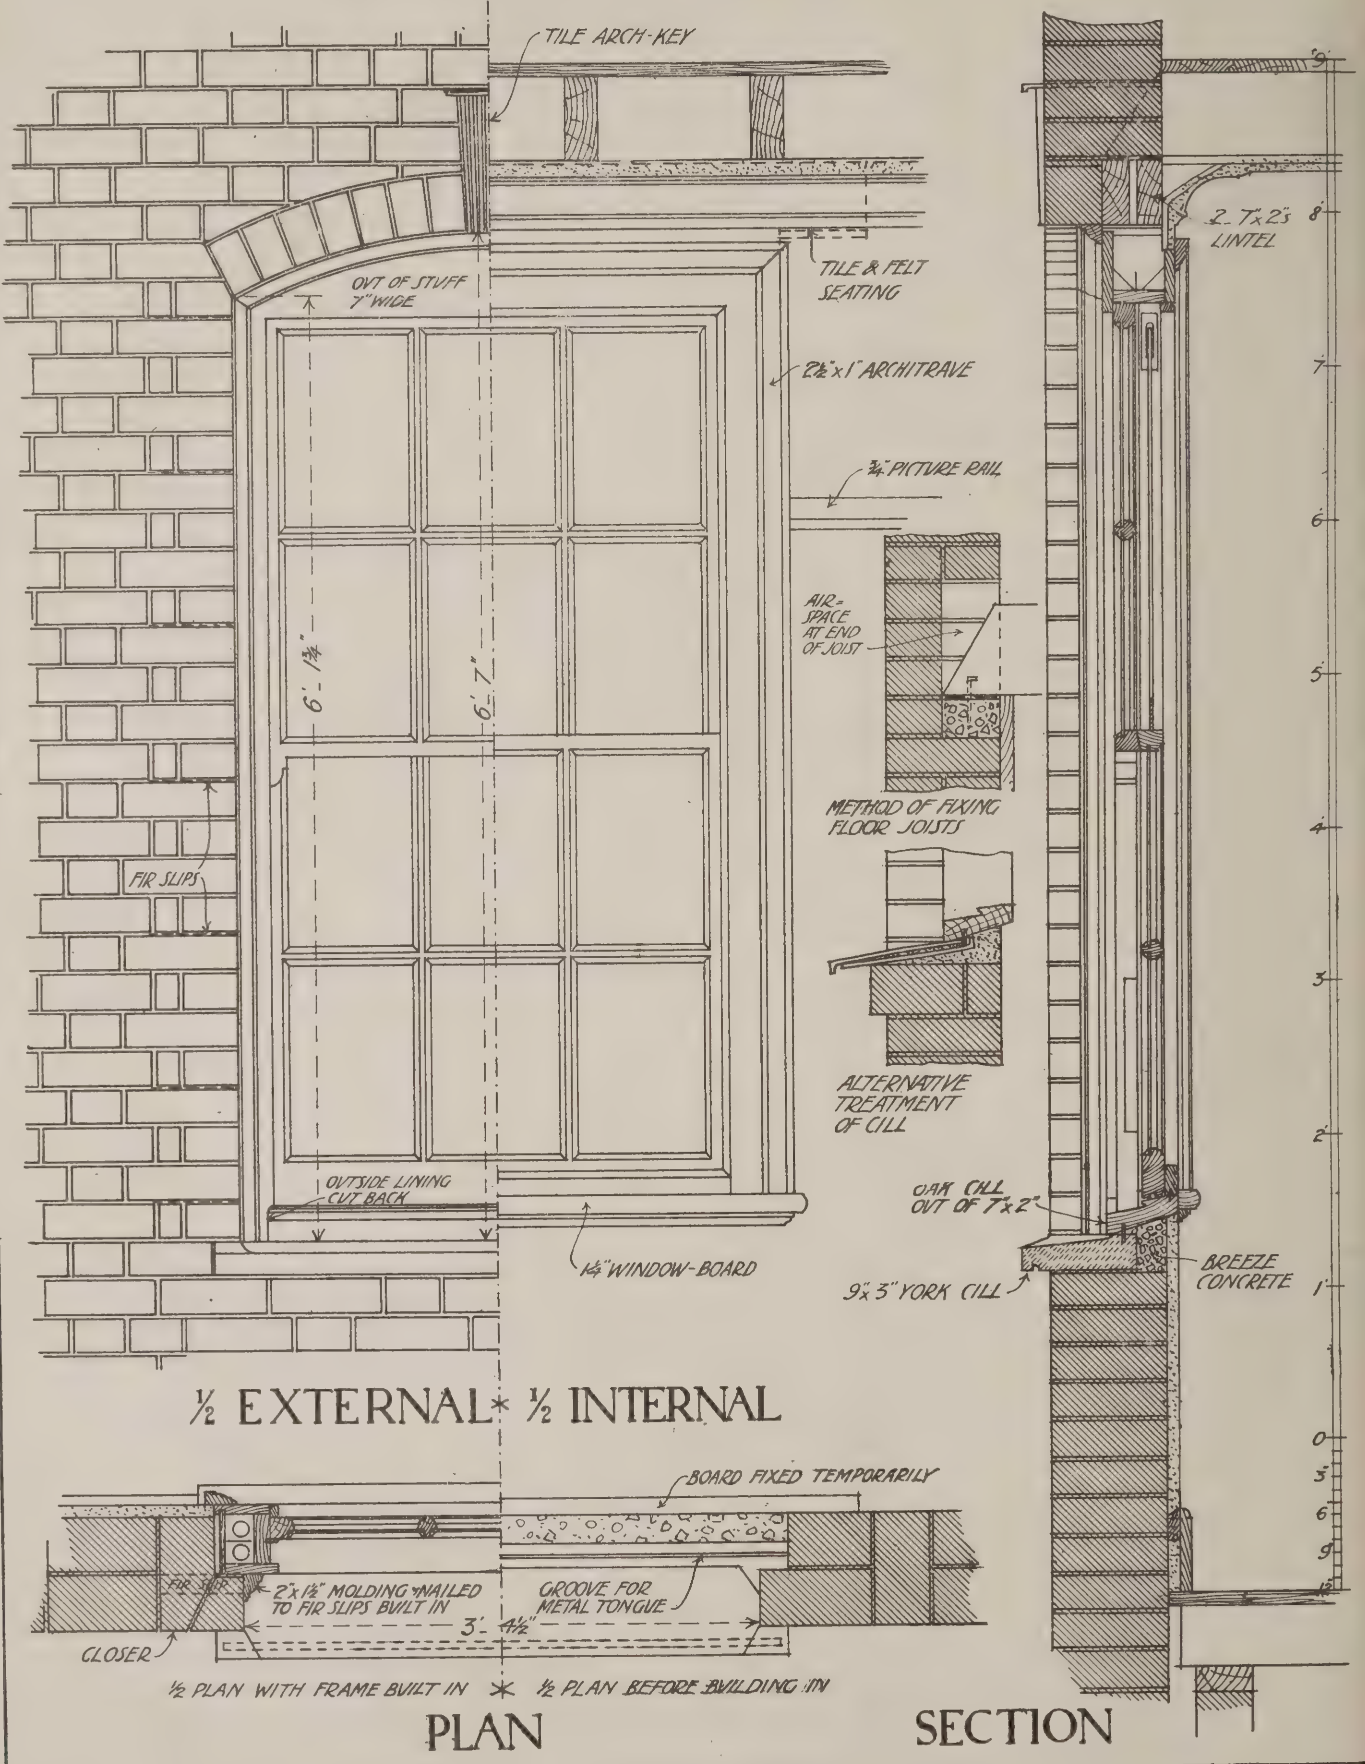
A Competition for Readers. We are doing very well, but we want to do still better. We want to increase our circulation. We welcome comparison with our contemporaries and we have proof that The Builders' Journal is appreciated, in the fact that it has achieved a foremost position among professional and trade weeklies. We know the merits of The Builders' Journal, but however good a thing may be there is always a certain amount of public inertia to overcome. Our readers at present are influential members of the architectural profession and building trades. We feel convinced that The Builders' Journal only requires to be better known in order that its circulation may increase enormously. We are, of course, not without ideas as to how this is to be done, but we should like to have other suggestions. We, therefore, offer a prize of five guineas for the best suggestion as to how we can increase our circulation. The feasibility of the suggestions will be considered by the editors, whose judgment will be final. No doubt our friends will be glad to help us with ideas, and to see us adopt their proposals, whether they win the prize or not; therefore we reserve the right to adopt any of the suggestions which we receive. Suggestions should be submitted before or on January 10th, addressed to the Editors of The Builders' Journal, 6, Great New Street, London, E.C., and the envelopes marked "Circulation." We shall announce the result of our decision in our issue for January 16th.

A COMMON SASH-WINDOW.



SASH WINDOWS.

Acquaintance with the likes and dislikes of the average dweller in suburbia leads to the conclusion that the sash window is one of his most cherished institutions. A sometime unhappy experience of the draught-inducing qualities of cheap, flimsy and ill-designed casements has apparently been responsible for this attitude. Be this as it may, however, the sash window, despite its rattling propensities, is popular, and it is a matter for regret that it appears usually in such hopeless ill-proportion and clothed in such poor and mean detail in the dwellings of the multitude. The accompanying drawing does not profess to show the best manner of constructing a double-hung sash and frame; but in it some attempt has been made to present a decently-proportioned and simply-detailed window, suitable for use in buildings of the cheapest description. Since cheap buildings must be erected, and need not necessarily be bad because they are cheap, no further excuse seems needed.

All architects will agree that the sash window looks its best when set in straight reveals, exposing the outside lining and approaching within a few inches of the external face of the walls, as in Georgian work. To this position, however, the 9-in. walls of the majority of suburban houses do not lend themselves; moreover, the obvious convenience of finishing the sash frame flush with the internal face of walls, and so abolishing jamb linings, makes the 4½-in. reveal preferred. There is no necessity why this should always confer the poor and mean appearance generally inseparable from its use. If the break in the reveal be made 2¼ins. instead of 4½ins. (thereby incidentally improving the brick bond) the sash frame, when built in, will expose a sufficient margin to allow a 2-in. × 1½-in. moulding to be carried round the sides and top of the opening, greatly improving its appearance, and having a distinct practical value. This moulding is fixed after the joint between reveal and frame has been pointed up, and is nailed to fir slips about 6ins. × 1½ins. × ⅜in. built in the mortar joints about 1ft. apart during erection. It keeps the pointing permanently in position and checks a good deal of draught which would arise if it were able to fall away (as it usually does).

The depth of jamb available in 9-in. walls is insufficient for a sash frame more than 5¼ins. thick—*i.e.*, 4½ins. plus the thickness of plastering. This is made up by ¾-in. outside lining, two 1¾-in. sashes, ⅜-in. parting bead and 1-in. inside bead. These, after working, will make up about 5¼ins. thick. Outside linings less than 1in. thick are best only nailed to the pulley stiles, as the working of a groove so near the free edge is liable to cause the lining to curl away from the sash, which so becomes loose. If the outside lining be cut back at the foot level with the face of the pulley stile, it prevents the lodgment against it of water falling on the wood sill, and so removes a frequent cause of decay, as all "dilapidation" surveyors can testify. An American device, saving both labour and material, is shown in the oak sill.

The stone sill is no larger than absolutely necessary; the space at the back of it can be filled in with breeze concrete, a board fixed temporarily across the opening being all that is necessary while filling in. For the alternative tile sill, tiles having a continuous nib are best—forming both a groove for water-bar and a drip on the front edge. Tiles of this pattern are made by several manufacturers — Messrs. Collier, of Reading, for instance.

In building in the frames galvanised hoop-iron cramps should be nailed to the linings about 18ins. apart, coming in the joints of the brickwork. A half-brick face arch built in cement, with a good camber, is stronger than inferior gauged work, and looks simple and workmanlike. To keep the extrados of the arch at the skewback level with a brick course, as shown, rather than the intrados, entails less difficult cutting of the spandrel filling bricks, otherwise there would be a birds'-mouth.

The sashes are shown with bars. The unreasonable opposition often taken to such desirable adjuncts leads one to suppose that most people spend all their time indoors looking out of windows. Besides the undoubted disturbance of scale (and consequent belittlement) which large undivided sheets of glass produce in the appearance of a small house, such sashes are bound to have a very short life, as they depend wholly on their tenons for stiffness. Division by reasonably-spaced bars effects a great improvement in all respects.

The window illustrated is suitable in proportion for a storey 10ft. from floor to floor—the limit under most by-laws for 9-in. walls.

One other detail not actually referring to the sash may be mentioned. To avoid bedding timber in the brickwork, the upper floor joists are secured by the following method, which is found to work well in practice:—The course below the level at which it is intended to bed the joists is a facing course with snapped headers. A board is fixed temporarily on the inside of the wall and the space between this and the facing course filled in with breeze concrete. When this has set, and before laying the floor joists, two rows of stout hoop-iron are laid on the breeze as a lateral tie, and the joists nailed to the breeze fillet between the two rows. The hoop-iron is carried across all openings, and although wood lintels are shown in the drawing, cast breeze concrete is preferable and quite easily made on the works. The method of cutting ends of joists saves 4½ins. in each length of timber, leaves an air-space at the end of each joist without lessening the bearing, and would allow the floors to fall, in case of destruction by fire, without levering over the walls above.

GOTHIC VAULTING.

At the students' meeting of the Manchester Society of Architects held on December 11th Mr. R. W. Orme read an interesting paper on "Gothic Vaulting." After giving a concise historical sketch of the evolution of Gothic architecture, and stating that it was the desire of the old builders to obtain a fire-resisting roof which first led to the adoption of a stone vault, the lecturer dealt with various kinds of vaults, commencing with the groined vault of the 11th century. Diagrams of each form were given. It was explained that the introduction of the pointed arch obviated at once the difficulty of vaulting oblong compartments, having horizontal ridges. The multiplication of the tierceron ribs led to the "rib and panel" vault, and later to the "conoid" form of the 15th century vaults. In conclusion the lecturer showed how the rib (which was such an important factor in early vault construction) lost, in later vaults, all its construction value, the vault becoming either all rib, as in the cloisters at Gloucester, or all panel, as in Henry the Seventh's Chapel at Westminster, which, although a marvellous piece of stone cutting, yet unfortunately lost the true essence of Gothic vaulting.

In the discussion that followed it was suggested that reinforced concrete ceilings might be treated in a somewhat similar manner to Gothic rib construction. The rather illogical method of covering a stone vault with a wooden roof was also noted, and it was considered advisable to let the vault tell its own tale, both internally and externally.

Notes on Competitions

University College of North Wales, Bangor

In the limited competition for the new buildings of the University College of North Wales to be erected at Bangor, the design of Mr. Henry T. Hare, F.R.I.B.A., has been selected by the Council on the recommendation of the assessor, Sir Aston Webb. The buildings are estimated to cost about £200,000. His Majesty the King is to be invited to lay the foundation-stone next summer.

London County Hall.

The recommendations of the Establishment Committee in regard to the competition for the London County Hall were brought before the Council last week, but the consideration of them was deferred. It seems hardly likely, however, that any change in the conditions will be made by the Council, so that architects may soon expect to be able to apply for copies. The competition will, of course, be the biggest held for years past.

List of Competitions Open.

Deposit for conditions given where known.

DATE OF DELIVERY	COMPETITION.
Dec. 31	LABOURERS' COTTAGES AT DUBLIN.—Premiums of £50, £30 and £20. Particulars from A. R. Barlas, secretary, L.G.B. Offices, Dublin. No deposit.
Dec. 31	DUAL SECONDARY SCHOOL AT GOOLE.—Premiums £50 and £25. Particulars from James W. Johnson, clerk to Governors, Council Offices, Goole. Deposit £2 2s.
Dec. 31	NURSES' HOME AT GENERAL HOSPITAL, WOLVERHAMPTON.—Particulars from J. Stephen Neil, House Governor and Secretary, General Hospital, Wolverhampton. No deposit.
Dec. 31	BATHS AT ASHTON-IN-MAKERFIELD.—Limited to architects in Wigan and Leigh Poor Law Unions. Particulars from A. Sykes, clerk, Council Offices, Ashton-in-Makerfield. No deposit.
1907 Jan. 5	SECONDARY SCHOOL AT GUISELEY, LEEDS (for 200 scholars).—Name by this date to M. Rennard, secretary to Governers, Guiseley, Leeds.
Jan. 12	LAY-OUT OF RIDDRIE ESTATE, GLASGOW.—Premiums of £75, £50 and £25. Particulars from A. W. Myles, town clerk, City Chambers, Glasgow. No deposit.
Jan. 19	LIBRARY AT PLYMOUTH.—Premiums £50, £30 and £20. MUSEUM AND ART GALLERY AT PLYMOUTH. Premiums £25, £20 and £10. Limited to local architects. Particulars from Borough Librarian, Plymouth
Feb. 1	CHILDREN'S HOSPITAL AT SUNDERLAND.—Premiums of £100, £50 and £25. Particulars from T. Robinson, secretary, Infirmary Offices, Bank Buildings, Sunderland. Deposit £1 1s.
Feb. 16	CONGREGATIONAL CHURCH, SCHOOL AND MANSE, GRIMSBY.—To cost £8,200. Premiums of 25, 15 and 10 guineas. Particulars from E. L. Bridge, Fish Docks, Grimsby. Deposit £2 2s.

MODERN ARCHITECTURE IN BERLIN.

By R. A. Raven.

Berlin is the third city of Europe. It is growing with astonishing rapidity, both in wealth and size. The wealth and fashion of Berlin, as in London and Paris, live in the West End, and the West End is spreading like fire. One great avenue cuts it in two, the Kurfürstendamm. This avenue has, along its eastern half, been finished for some time, as far as the handsome Kaiser Wilhelm Memorial Church—a converging point for the movement of the rich quarter. Westward, the Kurfürstendamm leads in a straight line to the rich suburb of Halensee and its still richer pendant, the Grunewald Kolonie. It is a great and important street, and in a few years will be still more important. Down the middle runs a three-lined ride for cavaliers, and double tramway lines. On each side of these are broad thoroughfares, flanked by wide pavements and lined with big houses. Everything has been well arranged by the authorities, except that they made no architectural arrangements for the building of the houses; and here is the eyesore. They are great ambitious four-, five- and six-storeyed palaces, these houses—so big that, though the street is long, there are not many of them. But it requires no very discerning ability to see that their architecture has no distinctive quality but that of shameless effrontery. The education necessary for the criticism of them is gained by looking through a few photograph albums of the famous buildings of the world, from the Pyramids to the Tower Bridge. A man armed with this minimum of education and a sense of humour will have an amusing quarter of an hour as he enters the Kurfürstendamm.

Let us take a few examples. Kurfürstendamm No. 50, the largest and most flagrant, occupies the obtuse angle at a corner where a side street enters the big avenue, and is imposingly arranged, with a central block at the corner and a wing at each side. Here is a brief résumé of the architecture of the central block :—The bottom storey, a restaurant, is unadorned, and bears no trace of the enormous weight it carries; only out of its upper part appear volutes, in the shape of lions, which support the chief features of the next storey. These features are, first, four enormous Corinthian columns, resting on the lion volutes, and not on Mother Earth, and supporting nothing; secondly, a large rotunda, of no visible use; thirdly, four Greek statues, arranged here and there on open spaces on the wall. As the eye now mounts to the third storey, it finds itself no longer in Greece, but in Potsdam or Dresden, in a maze of rococo and baroque ornament. One storey higher, and near the empty tops of the great Corinthian capitals, is an inscription in large advertisement-shaped letters, each about 2ft. 6ins. high, "Built A.D. 1901." We are now near the roof, but as all corner houses in the Kursfürstendamm boast some sort of tower (it seems a matter of good form to do so), we find an elongated dome, in shape and style somewhat similar to that of the Frauen church at Dresden. This, however, does not suffice; above this dome is another, a Gothic one—so far as it is possible to make a dome look Gothic; and, to finish the building off, a gilt-winged Victory stands on tiptoe on the Gothic dome.

So much for the centre block. The two side blocks are more elaborate. There are rococo "Atlases," supporting imitation urns, with imitation smoke columns. Greece is represented by both Doric and Corinthian columns, divided conveniently halfway to make room for a balcony, and flanked by massive caryatides. Other styles are not omitted. There are Romanesque windows; two sphinxes from Egypt, supporting heraldic shields—a pretty fancy; and above the red-tiled roof Night and Morning, copied from Michael Angelo's Medici tomb in Florence; and finished off with a Cleopatra's Needle.

But this is only one house. No. 42, for example, has a brick understorey, divided in two by a rich Byzantine doorway; it has sphinxes, cupids playing on harps, and satyrs blowing on pan-pipes; and at the top a huge bare gable, covered with an enormous "Kate Greenaway" fresco.

No. 47 has more Egyptian ware, two enormous columns supporting a vast roof, and themselves borne lightly, in one hand, by a reclining Rameses. No. 48 is remarkable for a palisade of griffins on a Doric peristyle; No. 65 for a design of naiads and two-bodied sphinxes; No. 63 for another of cherubs and peacocks; No. 183 for a Theomachy between the upstairs windows; No. 180 has Doric capitals with Egyptian bases, obelisks standing on the roof-line, each with a pair of plaster watch-lions, instead of watch-dogs, chained to it; the inevitable tower, and the sanguine inscription "Fortuna Fortes Adjuvat." But why continue? Why dwell on the Gothic pinnacles supporting owls of Minerva, the gable windows made to represent dragons' mouths, the portico with broken Gothic tracery, broken to make it look antique?

But it is past a joke. The sad history of it all is clear. A simple, uneducated people, the Prussians; an inrush of money into the country after a victorious war with the one nation who could teach them refinement; rapid commercial success; mushroom millionaires, who require gorgeous and flashy houses to live in; slum architects finding themselves called on to build palaces; Berlin folk charmed with the result, and making a point of sending visitors to see the fine buildings in "modern style" at Halensee—and, above all, in the Kurfürstendamm. The whole thing has been done lightheartedly; but in a few years there will be grief and remorse. The cultured Berliner, now hardly to be found outside the University, will have made his way and will have supplanted the retired army officer and the rich "Kaufman" from their leading position in society. Then there will be weeping, wailing and gnashing of teeth, and repenting in sackcloth and ashes. Then will the wretched Kurfürstendamm be the "Champs Elysées" of expanded West Berlin. And then, too late, will arise a writer with the eloquence of Ruskin and the sarcasm of Macaulay to pour scorn, contempt and the vials of wrath upon the shameless, undignified heads of those who to-day are erecting these hideous things.

Notes and News

Change of Address.—Mr. Horace Farquharson, architect, has moved from Elizabeth Street, Eaton Square, to 41, Montpelier Square, Knightsbridge: telephone No. 3457 Western.

New County Court Offices at Swansea are to be erected at the corner of Fisher Street and Frog Street. The work is to be put in hand at once, and is to be completed by the end of next year.

Smithfield Market Extension. — The foundation-stone of a building which will largely extend the area of the Central Markets, Smithfield, was laid last week. The work is estimated to cost £20,000.

New Baths in Glasgow were opened last week. They are in Cameron Street, Springbank, and have cost £8,000. There are 21 hot baths for men and 4 for women, with washhouse accommodation for 56 washers.

Spinning Mill for Todmorden.—A spinning mill to accommodate at least 80,000 spindles is to be built at once at Todmorden in a part of the Burnley Valley known as Harehill. A well-known Manchester mill architect has been engaged to prepare plans.

Exhaust Ventilation in Factories.—Numerous examples of well-planned installations of exhaust ventilation in factories, selected by Commander Sir H. P. Freer Smith, R.N., late Superintending Inspector for Dangerous Trades, have now been brought together in book form.

Messrs. L. Whitehead & Co., Ltd., builders and contractors, desire us to state that the serious fire which occurred at their store yard in Dorset Road, London, S.W., has not affected their workshops, stables and main yard at Portland Place North, Clapham Road, and in no way inconveniences them, except as regards loss of stock.

Bilston Town Hall.—The large baulks of timber with which Bilston Town Hall has been shored up since May last consequent upon subsidences due to old mine workings, as is thought, beneath the building, have now been removed. The foundation has been made secure by steel girders beneath the building and the roadway.

At the Palatine Road Congregational Church, Manchester, extensive alterations have been made under the direction of Mr. John Swarbrick, A.R.I.B.A., the general contractors being Messrs. Peace & Norquoy. The choir has been rearranged, the high gallery removed, and a new organ case erected, together with choir stalls and canopies in sequoia wood. The organ has been built by Mr. J. J. Binns, of Bramley, Leeds.

Blackfriars Bridge Widening.—The contract for the widening of Blackfriars Bridge has been let to Sir William Arrol & Co., of Glasgow, at £203,000. The bridge is now 43ft. wide, and the improvement will add another 30 ft to the roadway. The pavements will remain 16ft. wide. A curve will extend the north abutment of the bridge on to the Embankment, and the tram-lines will follow it. Steel caissons filled with concrete will be sunk by compressed air to form the basis of the granite piers, which will be connected by steel girders of extra strength. It is expected that the work will occupy two years and a half.

Architectural and Building Events of 1906.

THE year 1906 marks the completion of some large buildings of more than average importance. In London the huge block of the new War Office in Whitehall, designed by the late Mr. William Young, has been carried to completion by his son, Mr. Clyde Young, in conjunction with Sir John Taylor, of H.M. Office of Works. This is undoubtedly the most important building finished this year in the metropolis. In point of size, it ranks as one of the largest Government buildings in this country, but, excepting the front of Whitehall, with its fine colonnade, the exterior can hardly be considered worthy of its opportunity, though within the building the grand staircase has certainly a very fine effect. The other large Government building further down Whitehall is still enveloped in its scaffolding, but it has made considerable advance during the past twelve months and the shell is now practically complete. Most noteworthy on the exterior is the large tower in Great George Street, and the success of this lends point to the argument that was raised in Parliament as to the completion of the late Mr. Brydon's original design in this particular.

Another important London building finished this year is the Central Criminal Court in Old Bailey. Mr. Mountford's design for the building was adopted in competition, and the work as executed is a tribute to his ability. The building indeed has a very imposing appearance, and the sculpture by Mr. Pomeroy—more especially the startling figure of Justice which stands above the dome—adds great interest to the exterior. Within the building marble has been very extensively employed, and the great hall on the first floor beneath the dome is a notable achievement, with its lunette paintings by Prof. Moira and Sir William Richmond: it is not often that we see such a collaboration of architecture and painting in this country; the result at the Central Criminal Court, however, is eloquent of the advantages to be secured by such collaboration.

There have, of course, been a number of other important buildings completed in London during the year—the Ritz Hotel in Piccadilly; the companion block to Mr. Norman Shaw's building of New Scotland Yard; the Alliance Assurance building at the bottom of St. James's Street; the Hearts of Oak building in the Euston Road; and the Ecclesiastical Commissioners' offices at Westminster: but for details of these and other buildings we must refer readers to the pages that follow.

In the provinces undoubtedly the most important building finished during the year has been the magnificent block of new City Hall and the Law Courts in Cathays Park, Cardiff. These two buildings offered a great opportunity, inasmuch as they are erected in an open park with none of the usual restrictions of site and lighting, but it will be generally admitted that Messrs. Lanchester and Rickards have made fine use of their opportunity: they have been especially successful in regard to the sculpture work which is so important a feature of the exterior: this sculpture is the work of a band of young men of pronounced abilities, and under the controlling influence of the architects their work has reached a very high level.

Another great building completed this year is Marischal College, Aberdeen. Mr. Marshall Mackenzie, the architect, was here dealing with an old building, but in his granite structure, strong buttressed and restrained below and bursting above into fretted battlements and pinnacles, there is none of the old stock Gothic, but new work full of vigour; a majestic tower dominating the whole.

The King's Sanatorium at Midhurst, Sussex, must also be counted among the most important buildings of the year. Quite apart from its admirable planning, it calls for attention as a piece of brickwork design, while the unique open-air chapel connected with it is a most interesting and cleverly-arranged building.

To the list of Liverpool's buildings must be added the new Cotton Exchange and the new Bluecoat School, both completed this year—the former, with its great colonnaded front, at once commanding attention, the latter quiet in its general effect, but most refined in every detail.

Newcastle has also had two important buildings completed this year—the Infirmary and the Armstrong College.

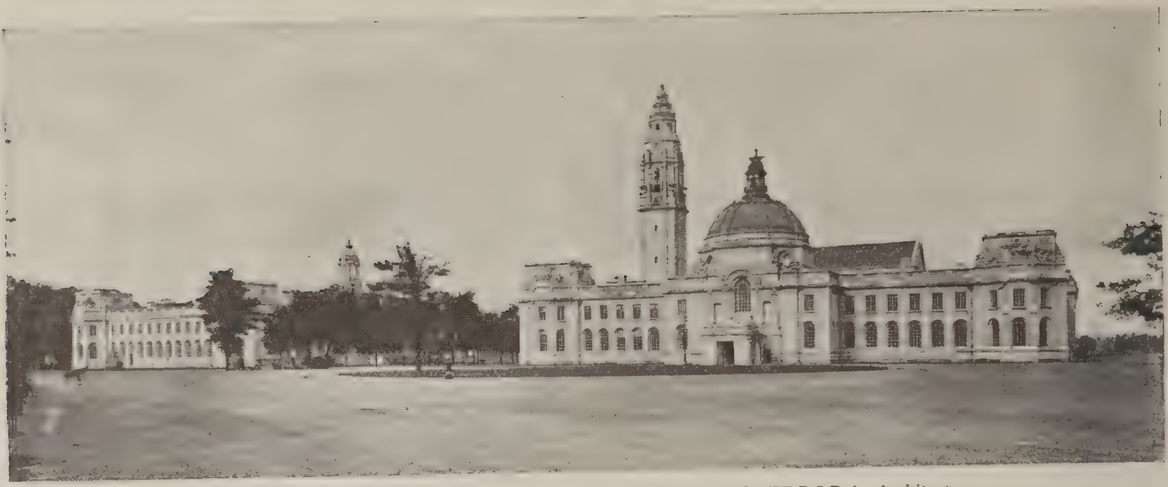
Manchester calls for notice by reason of the new central fire station recently finished; Birmingham for its new electricity generating station; Hull for the new general post-office in course of erection; Glasgow for its new parcels post office; York for the large office building of the North Eastern Railway Co.; Northallerton for its very interesting county hall; Bristol for its new central library.

Turning now from buildings to architectural matters, we have to record the election of numerous eminent architects to the Fellowship of the Institute—men such as Mr. Reginald Blomfield, Mr. E. S. Prior, Mr. Halsey Ricardo, &c., who for one reason or another had kept apart from such alliance. These are very noteworthy additions, and they augur well for the future. Included with them among new Fellows, however, one has to note many names which count for little, and we feel that the Associates who have protested so strongly against such wholesale direct election to Fellowship have had good reason in many cases.

During the year there has been the usual crop of competitions, and it is worth remarking that there has not been the familiar hue and cry by comfortably-established practitioners against the evil of it all: indeed, that old protest seems to have died, and we have had instead the very much more satisfactory efforts to secure proper conditions of competition. There have been no particularly large competitions in this country during the year, excepting, perhaps, the Bangor University College, but abroad there has been the competition for the Palace of Peace at the Hague, which ended in the selection of such a farcical design; and in South Africa there have been the large competitions for the new law courts at Cape Town and the Transvaal University College at Johannesburg. The conditions, however, for the new London County Hall have recently been made known and designs have been delivered for the Birmingham Council House extension, which competitions, inaugurated this year, will rank among the largest for 1907.

Three cathedrals have been the subjects of general interest during the year—St. Paul's, by reason of the subsidences at the south-west corner; Winchester, on account of the subsidences at the east end; and Exeter, for the "restoration" work in progress there. Selby Abbey was gutted by fire in September.

The International Congress of Architects held in London in July was the occasion of a considerable amount of mutual congratulation, and was officially pronounced to be a great success. For our own part, however, we could not see that it was of much account as a serious conference of architects. The meetings were very sparsely attended and resolutions which were excellent as originally put were whittled away to nothing in order to meet the wishes of all concerned. But as a social affair the congress was, of course, an immense success.



New City Hall and Law Courts, Cardiff. Lanchester and Rickards, FF.R.I.B.A., Architects.

TOWN HALLS AND MUNICIPAL BUILDINGS.

The new City Hall and Law Courts at Cardiff were opened by the Marquis of Bute on October 29th. The buildings are in Cathays Park, and are designed in a monumental style. Perhaps the finest portion is the central block of the City Hall with its magnificent dome covering the Council Chamber. The dome is crowned by a lead figure of the Welsh dragon, by Mr. H. C. Fehr. On the exterior of the buildings sculpture has been largely adopted, the groups being the work of Mr. Henry Poole, Mr. Paul Montford, Mr. Albert Hodge, and Mr. Fehr. The Assembly Hall is a large apartment with a very rich plaster ceiling by Mr. G. P. Bankart, and some fine electroliers suspended down the centre. The Law Courts block is divided into two main portions—the assize courts and the police courts. The cost of the two buildings was about £250,000. Messrs. Lanchester & Rickards were the architects, their design having been accepted in competition in 1897.

The new City Hall at Belfast was officially opened in September. This great building stands in the centre of Donegall Square, and has cost £300,000. The main façade is 300ft. long, the general height to the top of the balustrade being 55ft., while the four angle towers rise to 115ft., and the great peristylular dome to 173ft. The building provides accommodation for the city officials and their staffs, and also includes a suite of reception rooms for civic functions and a private suite of rooms for the Lord Mayor. The entrance hall, which is 70ft. by 40ft., is approached through a stone porte-cochère and vestibule. Out of the hall the grand staircase rises to the first floor, on which the principal apartments are disposed, these including a great hall, the Council Chamber, reception room, and banqueting hall. Marble and enriched plasterwork have been used lavishly throughout, giving a very rich appearance. Sir A. Brumwell Thomas, F.R.I.B.A., was the architect.

The new Town Hall at Woolwich was opened on January 13th. Externally the chief feature is the tower, while internally the main entrance hall is the most imposing feature: this hall is carried up two storeys, and is lined with marble, the main staircase to the upper floor being at one end. The statue in the hall is of Queen Victoria, and is the work of Mr. Pomeroy. The architect of this building also was Sir A. Brumwell Thomas.

At Northallerton the new North Riding Council Buildings were completed at the commencement of the year. The exterior is carried out in red brick with white stone dressings. The Council Chamber is 45ft. square, and lies at the rear of the building. The total cost of the work (inclusive of furnishing, roads, &c.) was about £33,000. Mr. Walter H. Brierley, of York, was the architect.

On February 27th the foundation-stone of the new Town Hall at Ossett was laid. The building will cost £20,000. Messrs. W. Hanstock & Son, of Batley, are the architects.

New Council Offices at Pontypridd, Mon., were opened on April 11th. Mr. Henry T. Hare was the architect. The cost of the building was about £16,000.

On July 21st the foundation-stone of the new Municipal Buildings at Lambeth was laid. Messrs. Warwick & Hall are the architects.

On July 25th the foundation-stone of the new Municipal Buildings at Bromley was laid. Mr. R. Frank Atkinson, F.R.I.B.A., is the architect, his design having been selected in competition. The cost of the building will be about £20,000.

A new Town Hall at Kirkintilloch was erected at a cost of £9,000, from designs by Messrs. Walker & Ramsay, of Glasgow.

On October 23rd the new Municipal Offices at Bodmin were opened. Mr. Reginald T. Buscombe, borough surveyor, designed the building.

At Bideford the new Municipal Buildings and Free Library were opened on February 7th. Mr. A. J. Dunn, of Birmingham, was the architect. The cost was £6,000.

New offices for the Frimley Urban District Council were erected at Camberley, from designs by Messrs. H. R. and B. A. Poulter, at a cost of £2,339.

A new Town Hall at Sutton Coldfield was opened on September 19th. The total cost was about £12,000. Mr. Arthur R. Mayston, of London, was the architect. This completes the scheme; the fire station, which forms part of the building, having been opened in November, 1905.

CENTRAL CRIMINAL COURT.

The new Central Criminal Court in Old Bailey, London, was completed from designs by Mr. E. W. Mountford, F.R.I.B.A., selected in competition. The building occupies the site of grim Newgate, and is faced with Portland stone. Surmounting the whole is the great dome rising to a height of more than 200ft., and covered by a bronze-gilt figure of "Justice" by Mr. Pomeroy, who also is responsible for the sculpture work on the front to Old Bailey. Dignity and impressiveness have been considered of primary importance, and ornament has been sparingly used. From the entrance hall rises a fine marble staircase to the great hall on the first floor. This hall is the chief internal feature of the building. It is lined with magnificent slabs of marble and embellished with lunette paintings by Prof. Gerald Moira and Sir William Richmond. Following the plan of the ground floor, corridors, lined with marble, branch away on either side, and off these are the four courts—two large and two small, each with its own suite of rooms for counsel, jury, witnesses, &c. The general contractors for the building were Messrs. Holloway Brothers.

GOVERNMENT BUILDINGS.

The new War Office in Whitehall was completed by November. The building occupies a huge site and is the most important Government building erected in London in recent years. The design was originally prepared by the late Mr. William Young in 1899, but he died before the foundations even were finished, and the task of carrying his building to completion was entrusted to his son, Mr. Clyde Young, in conjunction with Sir John Taylor, of H.M. Office of Works. On the Whitehall front is a fine colonnade, with curved pediments at the corners embellished with sculptured groups by Mr. Alfred Drury, A.R.A. Within the building the most impressive feature is the main staircase, while the rooms allotted to the Secretary of State, the Permanent Secretary, the Council of War, &c., are effectively carried out with oak panelling and finely carved fire-places: there are some magnificent marble mantelpieces from the old War Office. Work on the foundations was commenced in 1899, so that seven years were occupied in the erection of the building. Messrs. Foster & Dicksee were responsible for the work above ground. 26,000 tons of Portland stone was needed for the building, this having been supplied by the Bath Stone Firms, Ltd. Faience and wall tiling were entrusted to Messrs. Doulton & Co., Ltd.

The South Kensington Museum extensions have made good progress during the year. An army of workmen has been engaged and the shell of the buildings is now complete, with the exception of the tower, which is to be 220ft. high. Sir Aston Webb and Mr. E. Ingress Bell are the architects, and Messrs. Holliday & Greenwood are the contractors. The floor-space of the new museum will be about 13 acres, the frontages to Cromwell Road and Exhibition Road being more than a quarter of a mile, taken together. The work will not be completed for another two years. Its total cost will exceed £1,000,000.

It is interesting to note that the floors and domes of the building are reinforced with expanded steel, and all construction fire-resisting. The reinforcement is supplied by the New Expanded Metal Co.

On the site of Christ's Hospital, Newgate Street, London, a start was made with the work of erecting the new G.P.O. buildings, designed by Sir Henry Tanner, principal architect to H.M. Office of Works. It is noteworthy that these important new buildings will be erected on the Hennebique system of reinforced concrete.

A new parcels post building in Waterloo Street, Glasgow, was completed. The building provides large sorting halls, 25ft. high, and has cost £80,000. It has been carried out from designs prepared in H.M. Office of Works, Edinburgh.

At Hanley a new general post-office was erected from designs prepared in H.M. Office of Works.

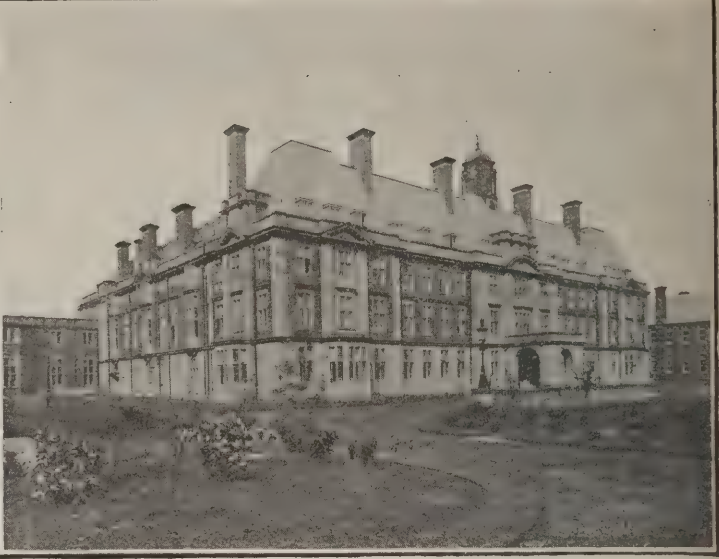
Nurses' Home, Newcastle Infirmary.



Administration Block, Newcastle Infirmary.

H. Percy Adams, F.R.I.B.A., and W. Lister Newcombe, F.R.I.B.A., Joint Architects.

INFIRMARIES.

The large new infirmary at Newcastle-on-Tyne was opened by His Majesty the King in July. The general scheme comprises an administration building centrally placed, with eight ward pavilions grouped on either side, and the usual other buildings disposed about the site. The main front faces Leazes Park. Within the building perhaps the most interesting portion is the hall of the administration block, which is panelled out in teak and leather, with peacocks thereon, and a finely modelled plaster frieze and ceiling. On the highest part of the site is a nurses' home. Mr. H. Percy Adams, F.R.I.B.A., was the architect, associated with whom was Mr. W. Lister Newcombe, F.R.I.B.A., of Newcastle. The total cost of the scheme was £300,000. Accommodation is provided for 400 beds.

In May the Board of Management of the Manchester Royal Infirmary accepted the tender of Messrs. Arnold & Son, of Doncaster (amounting to £239,546), for the general superstructure of the new infirmary, including three large four-storey blocks, and the medical and surgical departments. Mr. Edwin T. Hall, F.R.I.B.A., of London, and Mr. John Brooke, A.R.I.B.A., of Manchester, are the joint architects of the building.

At the Western District Infirmary, Glasgow, a new wing was erected from designs by Mr. J. J. Burnet. This provides three large wards (81ft. by 28ft. by 14ft. 8ins.) with appurtenant rooms.

At the Royal Infirmary, Glasgow, work on the northern wing of the new building was commenced. Mr. James Miller is the architect. The total cost of the entire scheme is likely to exceed £400,000.

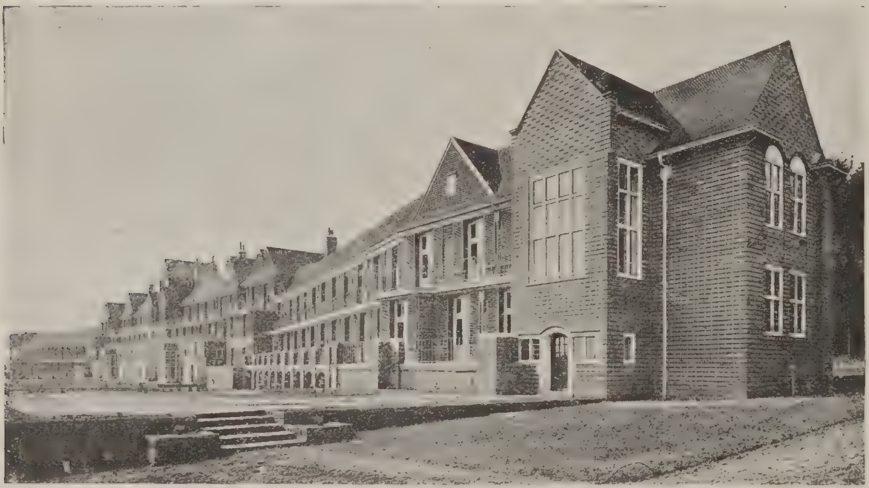
On October 23rd the Read Dispensary, at the junction of St. George's Road and Anchor Road, Clifton, Bristol, was opened. Mr. P. Hartland Thomas, of Bristol, was the architect.

New infirmary buildings at Kingston-on-Sea were erected from designs by Messrs. Clayton and Black, of Brighton.

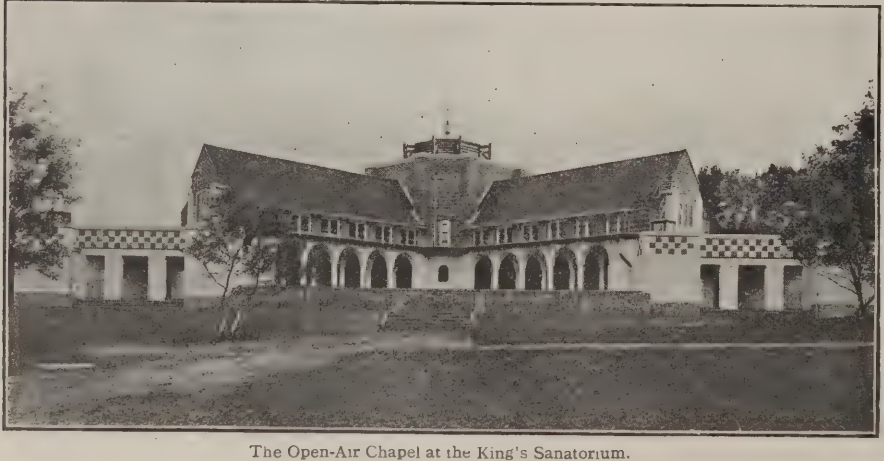
At Leeds the first portion of the extension scheme to the Beckett Street workhouse infirmary was completed. The complete scheme will make provision for 500 additional beds, bringing the total up to about 1,000. The cost is put at £100,000. Messrs. Thomas Winn and Sons, of Leeds, are the architects.

SANATORIA.

In June the King's Sanatorium at Midhurst, Sussex, was opened by His Majesty. It is a very notable building, both as a piece of brickwork design and as embodying the latest principles in the planning of a sanatorium. There are two main blocks—the administration block, facing north, and the patients' block, facing south; the latter comprising a centre portion with wings at an angle. The open-air chapel is quite unique and altogether a delightful example of modern design; on plan it takes the form of a V, the arms constituting two naves, for men and for women, with the pulpit in the "chancel" at the junction. It is interesting to note that the heating of this chapel, as also the dining hall, is carried out on the old Roman system, the floor itself, laid with slabs of York stone, being heated by steam pipes in channels below. Mr. H. Percy Adams, F.R.I.B.A., was the architect. The total cost of the building was about £130,000, this amount including the furnishing, which was carried out by Messrs. Heal & Son, who supplied bedroom suites specially designed to prevent the collection of dust and dirt.



The King's Sanatorium, Midhurst, Sussex. H. Percy Adams, F.R.I.B.A., Architect.



The Open-Air Chapel at the King's Sanatorium.

Sanatorium, Benenden, Kent. William West, Architect.

At Barrasford on the North Tyne a new sanatorium for consumptives was completed at a cost of £20,000. The buildings were designed by Messrs. Nicholson & Dotchin, of Newcastle.

At Blackpool Sanatorium the first portion of the extension was completed. Mr. F. T. Waddington was the architect.

At Benenden, Kent, the National Sanatorium for the working classes was begun, the foundation-stone having been laid in July by H.R.H. Princess Christian. The first section, comprising a block for 38 beds, with separate dining hall, kitchens, &c., will be ready for patients early in the New Year. The buildings have a steel frame filled in with "Frazzi" partition blocks, cement rough-cast externally and finished inside with Sirapite plaster.

ASYLUMS.

A new asylum for the county borough of Newport, Mon., was opened in February. The asylum is at Caerleon, and when quite completed will have cost more than £150,000. Accommodation is provided for 368 patients, in blocks two storeys high. Mr. A. J. Wood, of London, is the architect.

The new asylum for the City of York was opened on April 4th. It is situated at Naburn, about three miles from the city, and has cost £130,000, inclusive of site. The designs for the building were prepared by the city engineer, Mr. A. Creer. Accommodation is provided for 151 males and 211 females.

The Bangour Village Asylum, near Edinburgh, was opened by Lord Rosebery in October. Mr. Hippolyte J. Blanc was the architect.

The extension to the Plymouth Borough Asylum at Wrangaton, providing additional accommodation for 200 patients, was opened on June 6th. The cost of the work was about £32,000. Messrs. Hine & Odgers were the architects.

At Langho, near Blackburn, the colony for sane pauper epileptics was completed in the autumn. It is notable as the first State institution of its kind in this country. Accommodation is provided for more than 300 patients. The total cost (including site, 166 acres) has amounted to nearly £100,000. Messrs. Giles, Gough and Trollope, of London, were the architects, and Messrs. Robert Neill & Sons, of Manchester, the contractors.

HOSPITALS.

To the Rotunda Hospital, Dublin, an addition has been made from designs by Mr. A. E. Murray, F.R.I.B.A.

A commencement was made with the erection of the new buildings of King's College Hospital at Camberwell, for which Mr. W. A. Pite is the architect.

A new fever hospital was completed at Perth. Mr. G. P. K. Young, of Perth, was the architect. The cost was about £12,000.

At Bagnall the new North Staffordshire Joint Small-pox Hospital was erected, at a cost of about £7,000. It accommodates 39 beds. Mr. Elijah Jones, of Hanley, was the architect.

A new infectious diseases hospital was erected at Stanfield, Burslem, at a cost of about £11,000, Mr. Reginald T. Longden, of Burslem, being the architect.

A new infectious diseases hospital at Purdysburn, Belfast, was opened in August. Messrs. Young & Mackenzie were the architects.

ROWTON HOUSES.

"Bruce House," the "poor man's hotel," which the London County Council have built at a cost of £46,000 in Kemble Street, Drury Lane, was opened on July 13th. It contains 699 cubicles (let at 7d. per night), and dining-room accommodation for 400 men, with cooking ranges, &c., for the men's use, as in Rowton houses. "Bruce House" is the third institution of its kind erected by the London County Council, the other two being in Parker Street, Drury Lane, and "Carrington House," Deptford. Mr. W. E. Riley, F.R.I.B.A., was the architect. The cost of erection was about £46,000.

Hopkinson House, a kind of Rowton house for ladies engaged in professional work, was opened in Vauxhall Bridge Road, London. Mr. R. Stephen Ayling, F.R.I.B.A., was the architect. Accommodation is provided for 139 ladies.

At Newcastle-on-Tyne a "Rowton House" was completed. The building is at the top of Dog Bank, Lower Pilgrim Street, and contains more than 250 cubicles. Mr. J. C. Maxwell was the architect.

The ceilings to Brentwood Asylum have been plastered on expanded steel lathing, so as to be fire-resisting.

"Linolite" has been supplied to the new Central Criminal Court, Old Bailey, the new War Office and many other important buildings—by the Linolite Co., 25E, Victoria Street, S.W.

Messrs. Strode & Co. are carrying out the whole of the electric wiring for light and motors at the new "Morning Post" building, London, on their improved galvanised screwed steel conduit system: they are also carrying out the electric light work at the new building of the Alliance Assurance Co. in Capel Court, London, E.C.

New Schools, King's Lynn. Basil Champneys, Architect.

COLLEGES AND SCHOOLS.

The new buildings of Marischal College, Aberdeen, were opened by his Majesty the King on September 27th. These form a most important group, carried out in light-grey granite, which looks almost pure white when seen in sunshine. Marischal College has a frontage of 400ft. to Broad Street and a general height of 60ft. There is a long series of powerful-looking buttresses, very severe and restrained till they reach the top storey, when they burst into a rich array of pinnacles and frettled battlements; while above all rises the tower. The total cost of the buildings has been more than £200,000. Included in the scheme is a great hall. Mr. A. Marshall Mackenzie, A.R.S.A., F.R.I.B.A., was the architect and Messrs. D. MacAndrew & Co., of Aberdeen, were the contractors.

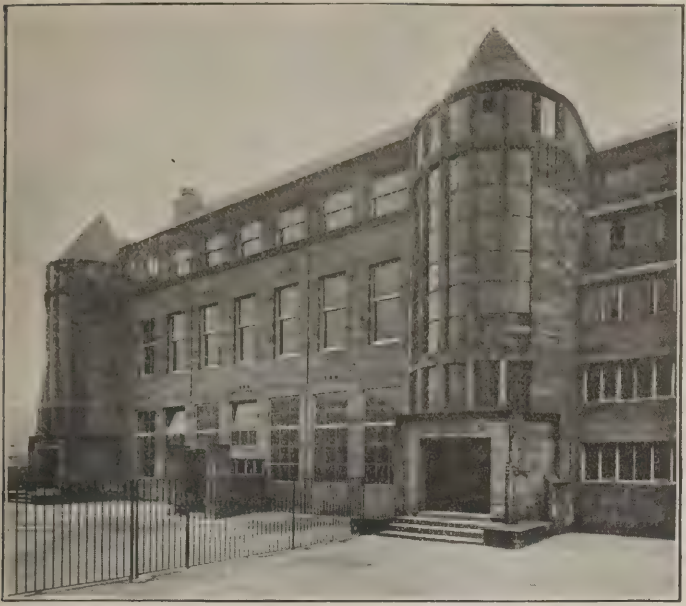
Nautical School, Portishead. E. Gabriel, F.R.I.B.A., Architect.

At Wavertree, one of the suburbs of Liverpool, the new Bluecoat School was formally inaugurated in June. The architects were Messrs. Briggs and Wolstenholme, F. B. Hobbs and Arnold Thornely. The school (which replaces the old Bluecoat Hospital in School Lane, Liverpool) provides accommodation for 250 boys and 150 girls. Behind the front block is a quadrangle in which is a central hall block, having a large dining-hall on the ground floor and the "Shirley Hall" on the floor above, the former being very effectively lined with green-stained whitewood and plaster, and the latter barrel-vaulted and panelled with whitewood left plain. At one side of the main front is the chapel and at the opposite side will be erected the swimming-bath and gymnasium, with a sanatorium beyond. The tower over the main entrance is not yet



Board School, Scotland Street, Glasgow. Honeyman, Keppie and Mackintosh, Architects.

built. The cost of the new school has been about £90,000.

In July the tender of Messrs. E. Turner & Sons for the erection of the South Wales University College in Cathays Park, Cardiff, was accepted — main building, £68,985; library, £18,862.

In July His Majesty the King opened the extensions made to the Armstrong College, Newcastle-on-Tyne. These comprise a principal front 300ft. long, with the Sir Lowthian Bell tower (120ft. high) and the examination hall, library, classrooms and laboratories. Mr. W. H. Knowles, F.S.A., of Newcastle, was the architect. The cost was more than £50,000.

On July 25th the foundation-stone of the new schools for University College at Frognal was laid. Mr. Arnold Mitchell is the architect. The total estimated cost is £110,000.

A new wing to the Durham University College of Medicine, Newcastle-on-Tyne, was opened in October. The cost of the addition was £11,000. Messrs. Dunn, Hansom and Fenwicke, of Newcastle, were the architects.

In January the new buildings of the Working Men's College at Camden Town were opened. A large assembly hall, gymnasium, library and various classrooms are provided. The total cost, including site, was about £30,000. Mr. W. D. Caröe was the architect.

A remarkable school in Scotland Street, Glasgow, was opened in the autumn. Messrs. Honeyman, Keppie and Mackintosh were the architects. The school is on the corridor plan, with 21 classrooms, 18 of which face south. An unusual appearance is given to the north front by the glazed bays lighting the staircases at either end. The cost of the school was about £15,000, accommodation being provided for 1,250 scholars.

Another new public school in Glasgow was erected in Cuthbertson Street, Coplawhill, at a cost of about £20,000, from designs by Mr. James Miller, A.R.S.A. It was opened on September 28th. Accommodation for 1,428 scholars is provided.

A new science building has been added to Trinity College, Dublin. Mr. Marshall was the architect.

The Girls' High School, Leeds, has been completed from designs by Messrs. Connon and Chorley.

The King Edward the Seventh School at Sheffield has been remodelled under the direction of Messrs. Gibbs and Flockton.

New buildings at University College, Reading, were completed at a cost of £50,000, from designs by Mr. W. Ravenscroft and C. S. Smith, F.R.I.B.A., of Reading.

At Dover work was commenced on the erection of the new Duke of York's School, which is to be transferred from Chelsea. The scheme has been prepared by Sir Henry Tanner, principal architect of His Majesty's Office of Works, and is likely to cost about £175,000.

At Bournville, Birmingham, the public schools built by Mr. and Mrs. Cadbury were completed. Mr. W. Alexander Harvey was the architect. Accommodation is provided for 540 scholars. The cost was £30,000.

New buildings were erected at Queen Elizabeth's Grammar School for Boys at Mansfield, from designs by Mr. John Bilson, of Hull.

The new nautical school at Portishead (architect, Mr. Edward Gabriel, F.R.I.B.A., London) was opened in May by H.R.H. Princess Christian. The building has a frontage of 382ft.

At Chorley the new technical school was completed from designs by Messrs. Cheers and Smith, of Blackburn. The total cost was about £15,000.

New council schools were erected at Watford, Altrincham, Barnsley, Gloucester, Farnham, Kingston-on-Thames, and other towns.

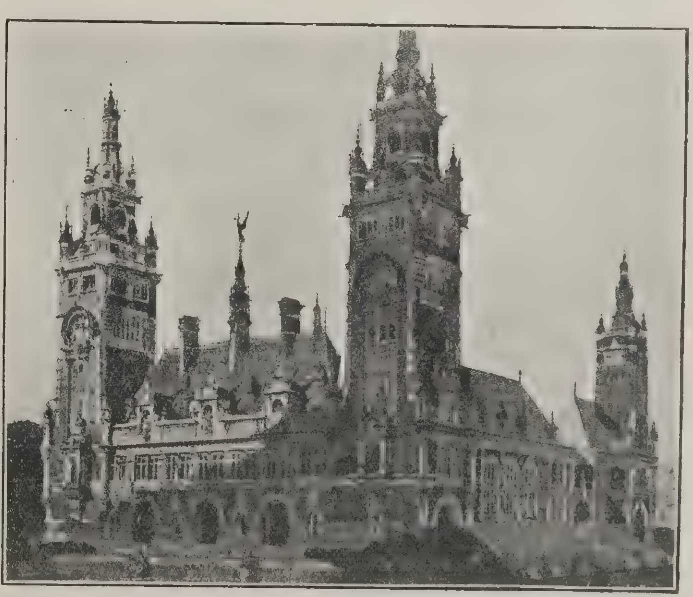
MILAN EXHIBITION.

The Milan Exhibition was opened in May. The architecture was of a particularly exuberant order—rioting in fact—and could not be regarded as satisfactory by people of any restrained ideas. The Peace Pavilion was appreciably quieter than the majority, and was perhaps the most pleasing of all the pavilions, but the main entrance, with a representation of the Simplon Tunnel, also deserves mention as full of new life and vigour, with a "Rodinesque" feeling in the sculpture freely employed. Messrs. Waring & Gillow were awarded a grand prix and gold medal at this Exhibition for high-class furniture and decorative work; and Messrs. Doulton & Co., Ltd., a Diploma of Honour and Grand Prix for sanitary appliances.



Peace Palace, The Hague. M. L.-M. Cordonnier, Architect.

COMPETITIONS OF 1906: SOME FIRST-PREMIATED DESIGNS.

COMPETITIONS OF 1906.

Award Announced	Building	Cost	Assessor	Successful Competitors	Remarks

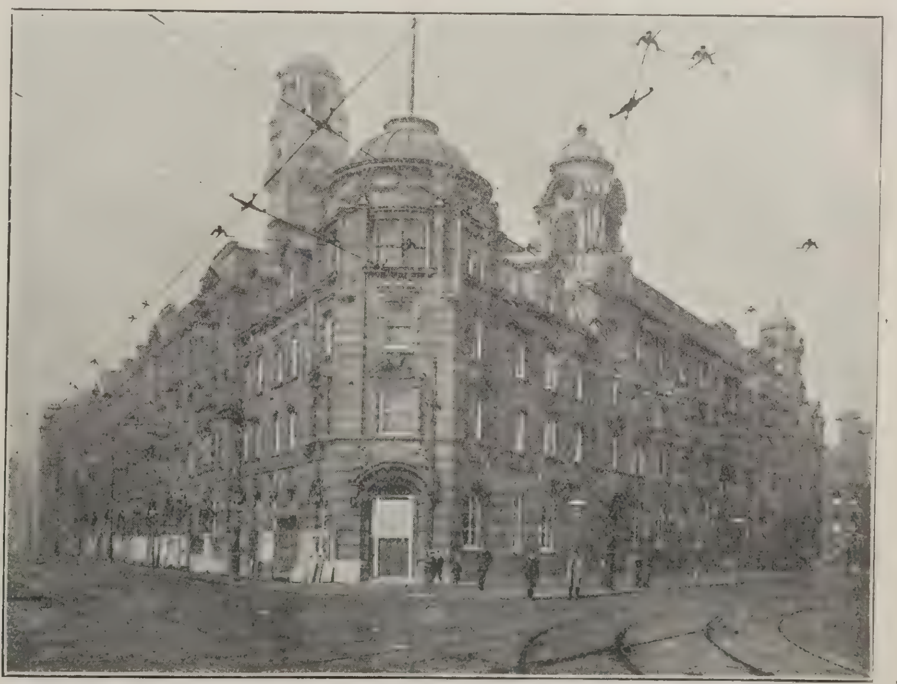
N.E.R. Offices, Great College Street, Westminster.
Horace Field, F.R.I.B.A., Architect.



New Central Fire Station, London Road, Manchester. Woodhouse, Willoughby and Langham, Architects.

NEW EXCHANGES.

The new Cotton Exchange at Liverpool was opened by the Prince and Princess of Wales on November 30th. The building has its main front in Old Hall Street, where a great blank wall with a magnificent range of columns against it hides the glass roof to the exchange hall, the chief feature of the interior. This hall is 140ft. by 128ft., and on ground and first floors is embellished with a granite colonnade. The building has a steel frame, and the north front is faced with cast-iron, this having been adopted in order to reduce the obstruction to light by piers, &c., as much as possible, in order to secure an abundance of even lighting for the cotton sale-rooms on this front. The building was erected with great rapidity by the Waring-White Building Co., Ltd., who employed about 700 men on the job. The total cost exceeds £250,000. Messrs. Matear and Simon, of Liverpool, were the architects. Altogether about 3,000 tons of steel have been used in the building, and 17,500ft. super. of ornamental cast-iron, this latter having been supplied by Messrs. Walter Macfarlane & Co., of Glasgow.

At Manchester the new Stock Exchange, designed by Messrs. Bradshaw and Gass, of Bolton and London, was completed and opened in December. The building fronts Norfolk Street and Pall Mall, and is faced with Portland stone with a grey granite base.

In St. George's Place, Glasgow, the extension to the Stock Exchange was opened in April. It follows the lines of the main building and provides a new mining market, a telephone corridor more than 100ft. long, general offices, &c. Mr. J. J. Burnet was the architect.

LIBRARIES, BATHS, &c.

On June 20 the new Central Library at Bristol was opened. The main front is to Deanery Road. On the ground floor are news-room, magazine-room and lending library (for 25,000 books), while on the first floor are the reference library, 150ft. long and 40ft. high, with space for 100,000 volumes, and "the Bristol Room," containing the Bristol collection of books. Mr. H. Percy Adams, F.R.I.B.A., of London, was the architect, his design having been selected in competition.

At North Islington a branch library was opened on September 20th. It is the first of five to be built in the borough, and is on the "open access" system. The cost was £9,000, Mr. Henry T. Hare being the architect.

At Beverley a new public library was completed from designs by Mr. John Cash.

At Harrogate the new Free Library facing Victoria Avenue and Raglan Street was completed. The lending library provides shelving for 40,000 books. Mr. Henry T. Hare, F.R.I.B.A., of London, was the architect. The cost of the building was about £8,000.

At Glasgow three more district libraries were completed—at Dennistoun, Bridgeton, and Hutchesontown.

At Morningside, Edinburgh, a branch library has been erected from designs by the city architect, Mr. R. Morham.

At Battersea the first portion of the new baths, museum and library in Plough Road was opened in August. The total cost of the scheme is about £11,000.

New baths at Handsworth were erected at a cost of £22,000.

In High Street, Manchester, the Victoria Baths were opened in September by the Lord Mayor. The designs for the building were prepared by Mr. Henry Price, city engineer.

New tramway offices and depôt were erected at West Ham from designs by the Borough Engineer, Mr. John G. Morley, A.M.I.C.E., at a cost of about £40,000.

In Hatton Garden, Liverpool, the new tramway offices designed by the Corporation Architect and Surveyor, Mr. Thomas Shelmerdine, were completed, so far as the exterior is concerned, and advanced considerably inside.

New L.C.C. fire stations at Herne Hill, Brixton, and Greycoat Place, Westminster, were completed from designs by Mr. W. E. Riley.

The Central Forward Movement Hall at Newport was opened on October 4th.

At Manchester the new Central Fire Station was opened by the Lord Mayor on September 27th. The total cost, including site, has been about £145,000. The engine-house has space for seven vehicles, and stalls for 14 horses, the exits being into Fairfield Street. Residences are provided for the officers, and there are 35 tenements for firemen. Messrs. Woodhouse and Willoughby, of Manchester, were the architects.

In Dublin, at the corner of Great Brunswick Street and Tara Street, a new central fire-brigade station was erected from designs by Mr. C. J. M'Carthy, city architect.

A new public abattoir at South Shields was completed in Station Road, from designs by Mr. S. E. Burgess, borough engineer and surveyor. The main slaughter hall is 140ft. by 27ft. The total cost was about £17,500.

The new Central Police Office in St. Andrew's Square, Glasgow, was completed from designs by the City Engineer, Mr. A. B. M'Donald, at a cost of £40,000.

In Whitecross Street, London, E.C., the new Weights and Measures Office was opened by the Lord Mayor on September 19th. The building cost £6,000, and was erected from designs by the City Surveyor, Mr. Sydney Perks, F.R.I.B.A.

At Birmingham the great new power station in Sumner Lane was completed, after having been in course of erection for about two years. It has cost £200,000, and comprises engine-house, boiler-house, and economiser-house, each 275ft. long. There are two chimney stacks, the larger being 230ft. high and of 15ft. inside diameter. The architects were Messrs. Ewen Harper and Brother, of Birmingham, the building contract having been carried out by Messrs. William Sapcote & Sons, also of Birmingham.

At the end of May the new electricity generating station at Greenwich for the L.C.C. tramways was opened.

At Manchester a special committee appointed by the Corporation to report on the future use of the old Infirmary site in Piccadilly recommended the allocation of the ground for the erection of a new art gallery, museum and library.

BOOKS OF THE YEAR.

Cottages and Small Houses.

"Cottages and Week-End Houses," by J. H. Elder-Duncan, 5s. (*Cassell.*)

"Modern Suburban Houses," by C. H. B. Quennell, 16s. (*Batsford.*)

"The Modern Home," 5s. (*Hodder & Stoughton.*)

"Houses and Gardens," by M. H. Baillie Scott, 31s. 6d. (*Newnes.*)

"Bournville," by W. Alexander Harvey, 8s. 6d. (*Batsford.*)

"The American Country House," by Charles E. Hooper, 15s. nett. (*Batsford.*)

Architecture, Ornament, &c.

"Impressions of Japanese Architecture," by Ralph Adams Cram, 10s. 6d. (*John Lane.*)

"Reason in Architecture," by T. G. Jackson, 10s. 6d. (*John Murray.*)

"Architectural Sketching and Drawing in Perspective," by H. W. Roberts. (*Batsford.*)

"Reason as a Basis of Art," by C. F. A. Voysey, 1s. (*Elkin Matthews.*)

"A Glossary of English Architecture," by T. D. Atkinson, 3s. 6d. (*Methuen & Co.*)

"The American Vignola," by William R. Ware, Part II., 12s. 6d. (*Batsford.*)

"Alphabets Old and New," by Lewis F. Day, 2nd edition, 3s. 6d. (*Batsford.*)

"The Art of Garden Design in Italy," by H. Inigo Triggs, 73s. 6d. (*Longmans, Green.*)

"A Manual of Historic Ornament," by Richard Glazier, 6s. (*Batsford.*)

"The Cathedrals of England and Wales," by T. Francis Bumpus, 3 vols., 6s. each. (*T. Werner Laurie.*)

"The Cathedrals and Churches of the Rhine and North Germany," by T. Francis Bumpus. (*T. Werner Laurie.*)

Building Construction, Ventilation, &c.

"Building Construction," by Charles F. Mitchell, Elementary, 7th edition, 3s.; Advanced, 5th edition, 5s. 6d. (*Batsford.*)

"Modern Buildings: Their Planning, Construction and Equipment," by G. A. T. Middleton, 10s. 6d. each part; 4 parts. (*Caxton Publishing Co.*)

"Cassell's Building Construction," by Prof. Henry Adams. (*Cassell.*)

"Modern Practical Carpentry," by George Ellis, 12s. 6d. (*Batsford.*)

"The Building Mechanics' Ready Reference," by H. G. Richey. (*Chapman & Hall.*)

"Handbook for Superintendents of Construction, Architects, Builders, and Building Inspectors," by H. G. Richey. (*Chapman & Hall.*)

"Building Details," by Frank M. Snyder. 6s. 6d. (*Technical Journals, Ltd.*)

"Symmetrical Masonry Arches," by M. A. Howe. (*Chapman & Hall.*)

"Experiments on Hot Water Systems," by A. Sayers. (*Sanitary Publishing Co.*)

"The Ventilation, Lighting and Heating of Dwellings," by J. W. Thomas, 6s. (*Longmans, Green & Co.*)

"Sanitary Engineering," by Francis Wood, 2nd edition. (*Charles Griffin & Co.*)

Professional.

"The London Building Acts, 1894 to 1905," by Bernard Dicksee, 2nd edition. (*Stanford.*)

"Dilapidations," by Banister Fletcher, 6th edition, 6s. 6d. (*Batsford.*)

"Building Contracts, Building Leases, and Building Statutes," by Matthews & Ball, 4th edition. (*Butterworth & Co.*)

"London Building Acts (Amendment) Act, 1905," by Barnard C. Molloy, 5s. ("*Estates Gazette, Ltd*))

"Building Contracts," by Alfred A. Hudson. 3rd Edition, 2 vols., £2 12s. 6d. (*Sweet & Maxwell.*)

"Party Walls," by A. R. Rudall, 7s. 6d. (*Jordan & Sons.*)

"Dangerous Structures," by George H. Blagrove, 4s. 6d., 2nd edition. (*Batsford.*)

Special Treatises.

"Crematoria in Great Britain and Abroad," by Albert C. Freeman. (*St. Bride's Press.*)

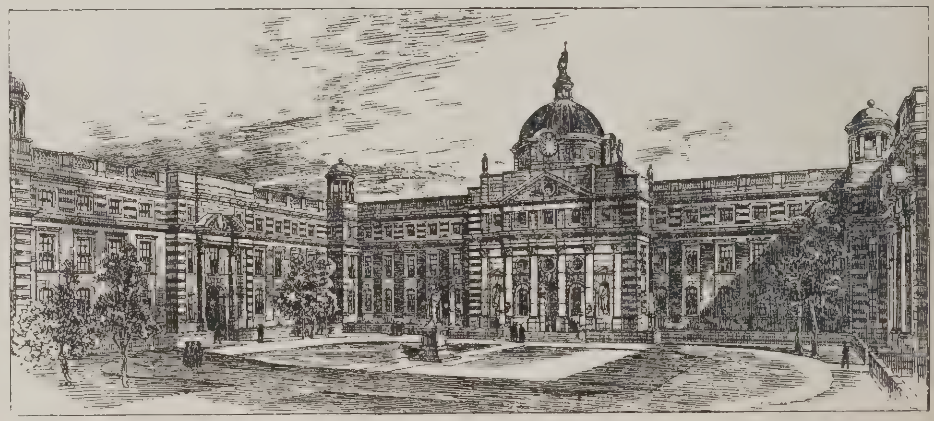
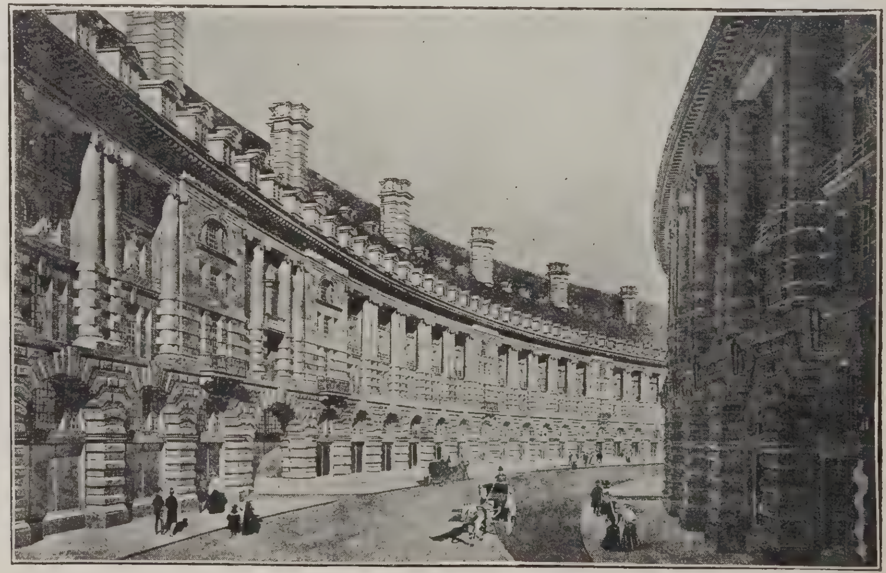
Geoffry Lucas, A.R.I.B.A., Architect,

THE ACADEMY.

In the Architectural Room at the Academy this year the most important and interesting scheme shown was Mr. Norman Shaw's rebuilding of Regent Street Quadrant. The new Piccadilly Hotel, which has a long front to the Quadrant, was the occasion of the scheme. Mr. Shaw tackled the work boldly and produced a fine design. After the exhibition of it at the Academy the scheme was assailed by the shopkeepers, who, clamorous for unlimited window-space, thought they saw a great injury being done to them by Mr. Shaw's projections between their shops. Mr. Shaw also exhibited at the Academy a much-wanted scheme for remodelling Piccadilly Circus, reducing its present chaos to a reasonable orderliness. Among the other exhibits at the Academy may be mentioned the Royal College of Science and Government offices at Dublin, of which Sir Aston Webb is joint architect with Mr. T. Manly Deane; a very interesting detail of the new Admiralty buildings to be erected at the east end of the Mall, also by Sir Aston Webb; a fragment of the new United University Club by Mr. Reginald Blomfield; Mr. Hare's fine design for the Provident Institution building now being completed opposite St. Clement Danes' Church in the Strand; the Royal Exchange buildings by Messrs. Ernest George and Yeates; a very clever design for a women's hospital in Soho Square, by Mr. Percy Adams; a detail of a block of city offices (Winchester House) by Mr. Belcher; the new town hall for Lancaster—a very dull building—by Mr. Mountford; Bournemouth Municipal Buildings, for which Mr. Mallows and Mr. Lacey are joint architects; a few good church designs—by Mr. Skipworth, Mr. Spooner, Messrs. Nicholson and Corlette, and Mr. Mileham especially; and a reputable collection of houses, large and small, up and down the country.



Royal College of Science and Government Buildings, Merrion Street, Dublin. Sir Aston Webb, R.A., and T. Manly Deane, A.R.H.A., Joint Architects.



Rebuilding of Regent Street Quadrant. R. Norman Shaw, R.A., Architect.

FROM THE ACADEMY.

ASSURANCE BUILDINGS, BANKS.

In St. James's Street, London, the new building for the Alliance Assurance Co. was completed. It is planned around a central court and is built entirely of Portland stone. Mr. R. Norman Shaw, R.A., and Mr. Ernest Newton were the joint architects.

A new building of the Prudential Assurance Co. in Dale Street, Liverpool, was erected from designs by Mr. Waterhouse.

In London Street, Norwich, new premises for the London & Provincial Bank were erected from designs by Messrs. G. J. and F. W. Skipper.

The Hearts of Oak Benefit Society's new premises in Euston Road, London, were opened by His Majesty the King on May 26th. The building cost £100,000. Messrs. Essex, Nicol and Goodman, of Birmingham, were the architects. There is a large general office on the ground floor, and on the first floor a delegates' hall seated for 210.

Work was commenced on the new offices for the London, Edinburgh and Glasgow Assurance Co. on the west side of Euston Square. Prof. Beresford Pite is the architect.

In St. Vincent Street, Glasgow, one wing of the large new building for the Scottish Provident Institution was completed and work on the remaining portion proceeded with. Mr. J. M. Dick-Peddie is the architect. In St. Enoch Square the erection of the new building for the National Bank of Scotland was proceeded with (architect, Mr. Alexander N. Paterson, M.A., A.R.I.B.A.).

A new bank in Market Square, Dover, was erected from designs by Mr. F. W. Waller, of Gloucester. For the illustration on p. 335 we are indebted to the "Dover Express."

BUSINESS PREMISES, WAREHOUSES.

In June the opening of the splendid new building of Messrs. Waring & Gillow, in Oxford Street, attracted great attention. The problem which the architect (Mr. R. Frank Atkinson, F.R.I.B.A.) had to solve was to provide an enormous floor area, to provide as great a superficies of window as was compatable with dignity, and to challenge attention. This problem, it will be generally admitted, he has solved very successfully. The building is faced with red bricks, relieved with stone, which, around the heads of the circular windows, and in other parts, is very richly carved. Within the building is a spacious entrance hall leading into a rotunda 54ft. in diameter and 85ft. high, off which on the several floors are ranges of rooms. The linen shop, carried out in waxed mahogany, is unique, while other fine apartments are the antique salon (decorated in Georgian style), the restaurant —essential modern in treatment, and the ladies' room adjoining. The floors throughout the building were constructed by the Columbian Fireproofing Co., Ltd., of London.

New premises for Messrs. Novello & Co., music publishers, were completed in Wardour Street, from designs by Mr. F. L. Pearson, F.R.I.B.A. The building includes a hall 44ft. by 36ft. by 24ft. high, which takes the place of the old shop.

A new warehouse for Messrs. William McGeoch & Co., Ltd., was erected in West Campbell Street and Cadogan Street, Glasgow, and a very high reinforced concrete office block in Hope Street from designs by Messrs. Salmon and Son and Gillespie.

A new packing warehouse and offices in Whitworth Street, Manchester, was carried on towards completion, from designs by Mr. H. S. Fairhurst, A.R.I.B.A., of Manchester. The building is expected to be finished next February.

At Aylesbury new printing works for Messrs. Hazell, Watson & Viney were erected with great rapidity, from designs by Mr. W. Ernest Hazell, A.R.I.B.A., of London.

THEATRES.

A new theatre at Cardiff, by Messrs. Ernest Kuntz & Ford, was opened by Mr. Beerbohm Tree in December.

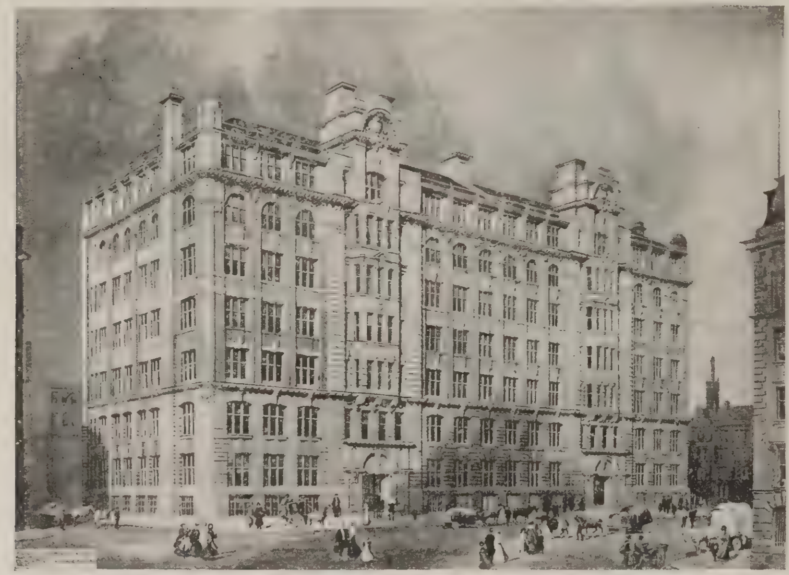
At Aberdeen a new theatre was completed from designs by Messrs. Frank Matcham & Co. It will seat 2,500 persons. The cost of the building was £35,000.

The old "Royal" music-hall on Holborn was converted into the "Holborn Empire" at a cost of £30,000, from designs by Messrs. Frank Matcham & Co.

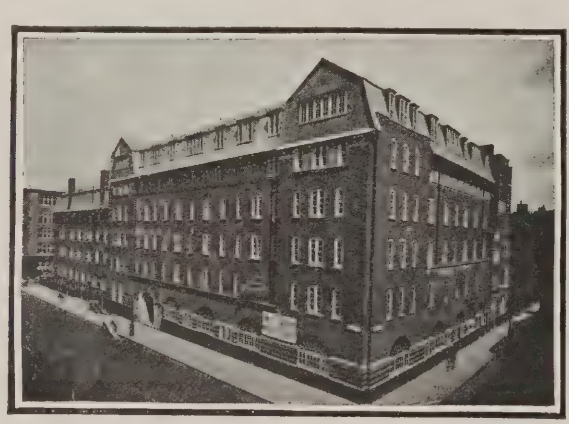
At Putney the Hippodrome was completed, from designs by Mr. F. W. Kingston.

In Shaftesbury Avenue the new Hicks Theatre was erected.

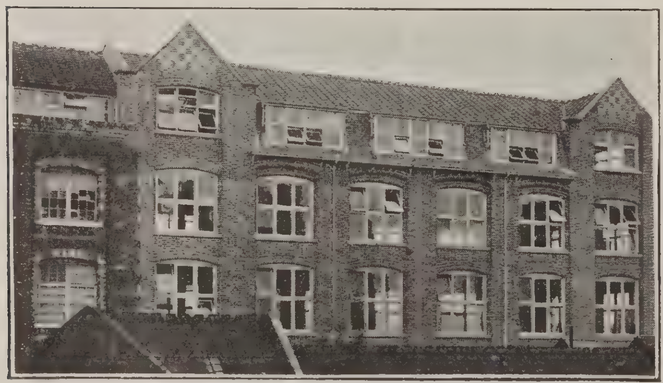
At Edinburgh the new King's Theatre in Leven Street was opened in December. Messrs. James Davidson, F.R.I.B.A., and J. D. Swanson were the joint architects. The cost of the building was about £50,000.



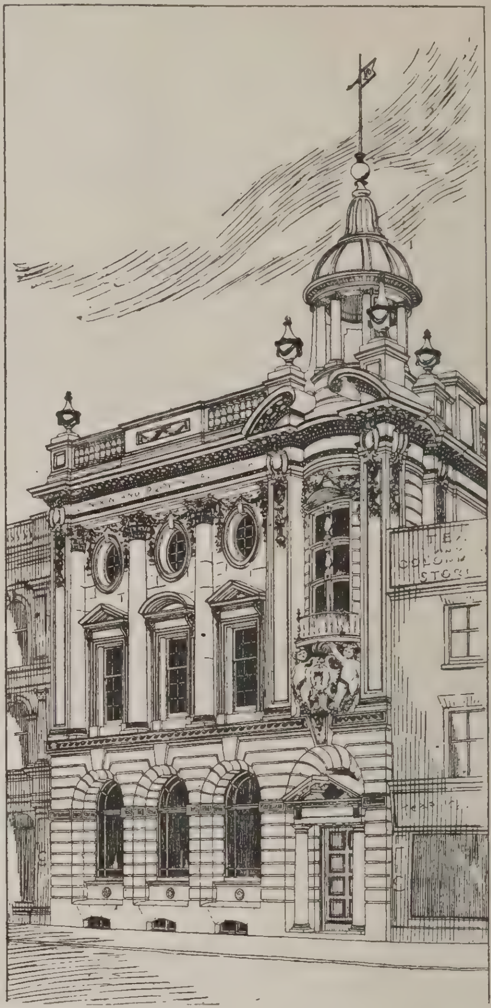
Packing Warehouse and Offices, Whitworth St., Manchester. Harry S. Fairhurst, A.R.I.B.A., Architect.



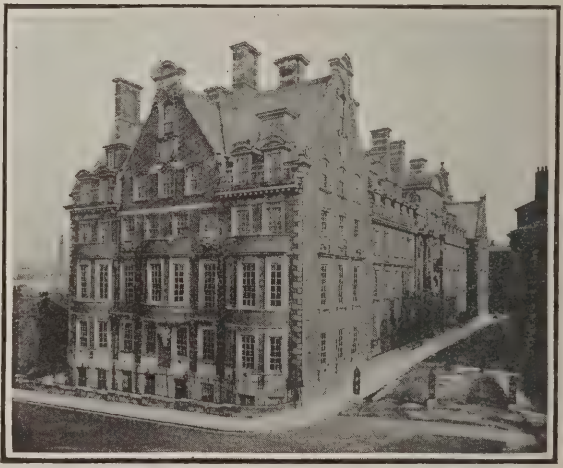
Bruce House, Drury Lane, London. W. E. Riley, F.R.I.B.A., Superintending Architect L.C.C.



Printing Works, Aylesbury. W. Ernest Hazell, A.R.I.B.A., Architect.



London and Provincial Bank, London Street, Norwich. G. J. and F. W. Skipper, Architects.



N.E.R. Offices, York. Horace Field, F.R.I.B.A., and William Bell, F.R.I.B.A., Joint Architects.

OFFICE BUILDINGS.

At Liverpool great advance was made with the huge new building for the Mersey Docks and Harbour Board, and the exterior is now practically finished, while the interior is in the hands of painters, decorators, and others engaged on finishing work. The façades are of Portland stone, and the central dome is 74ft. in diameter at the base, the top of its cupola being 223ft. above pavement level. The front and rear frontages of the building are each 264ft. in length, and the side frontages not much short of that. The total cost of the building, including fittings, will be about £300,000. Messrs. Briggs and Wolstenholme, F. B. Hobbs and Arnold Thornely are the architects, and Messrs. William Brown and Sons, of Manchester, are the contractors.

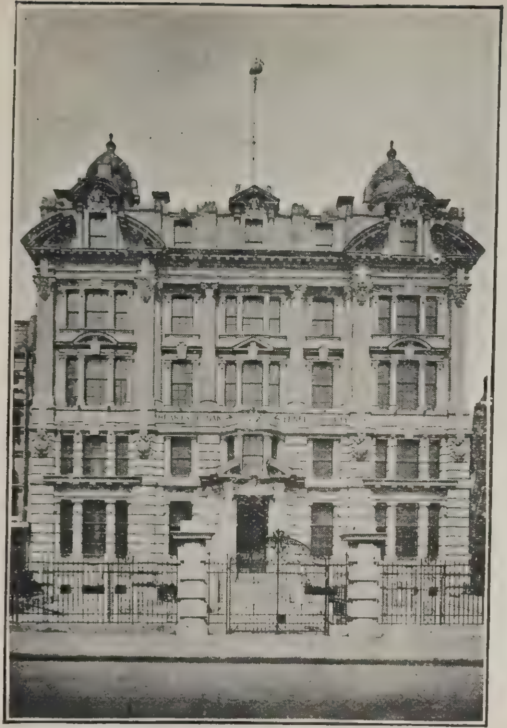
On September 24th the Ecclesiastical Commissioners moved into their new building at the corner of Millbank Street and Great College Street, Westminster. Mr. W. D. Caröe was the architect.

At the corner of Aldwych and the Strand, London, the new "Morning Post" building was commenced early in the year. Messrs. Mewès and Davis are the architects, and The Waring-White Building Co., Ltd., the contractors; the granite work being by Messrs. A. & F. Manuelle, Ltd., of London.

At York an imposing block of offices for the North-Eastern Railway Co. was completed, after having been in course of erection for five years. Nearly 200 rooms are provided, the largest being the boardroom on the first floor. Mr. Horace Field, F.R.I.B.A., of London, and Mr. William Bell, F.R.I.B.A., of York (chief architect to the company), were responsible for the design.

Caxton House, Westminster—a large block of office premises in Tothill Street, adjacent to the Aquarium site for the new Wesleyan Hall—was completed from designs by Mr. J. S. Gibson, F.R.I.B.A. Rather a novel feature is the use of wood casements for all windows.

In South Parade, Leeds, the office block for the Phœnix Insurance Co. was completed from designs by Mr. W. H. Thorp.



Hearts of Oak Offices, Euston Road, London.
Essex, Nicol and Goodman, Architects.

Parr's Bank, Woodford.
E. Guy Dawber, F.R.I.B.A., Architect.

HOTELS.

The Ritz Hotel, in Piccadilly, London, was opened in June. This building is notable not only as a piece of architecture, but also for the fact that it was the first complete example in this country of American methods of steel-frame construction. The work reflects great credit on all concerned—on Messrs. Mewès & Davis, the architects; on the Waring-White Building Co., Ltd., the contractors; and on Messrs. Waring and Gillow, the decorators and furnishers. The hotel is faced with Norwegian granite, and has a colonnade on the Piccadilly front. Within the building the chief apartments are the restaurant, looking on to the Green Park, the winter garden, and the banqueting hall and ballroom in the basement. More than 150 bedrooms and salons are provided, and about 75 bathrooms, the rooms being arranged in suites and carried out in the most luxurious style.

After lying idle for a long time, work on the new Waldorf Hotel, in Aldwych, London, was recommenced in earnest early in the summer, and at the present time the steel frame of this large building is well advanced, and the granite facing on Aldwych up to second-floor level. Messrs. A. Marshall Mackenzie & Son are the architects, and Messrs. The Waring-White Building Co., Ltd., are the contractors.

At the bottom of Southampton Row, London, the Tollard Hotel was erected from designs by Messrs. Bradshaw and Gass. We believe this is the first hotel in London to have hot and cold water laid on to lavatory basins in the bedrooms; another feature is that there are no urinals, the "Only" silent non-ball valve closet being fitted throughout.

In Russell Square, London, the Imperial Hotel was erected from designs by Mr. Fitzroy Doll, F.R.I.B.A. The floors throughout and the roofs are by the Kleine Patent Fire-resisting Flooring Syndicate, Ltd.

The Ivanhoe Hotel, at the corner of Bloomsbury Street and Great Russell Street, London, was completed in the early part of the year. The hotel includes 20 suites of rooms and 250 bedrooms. Mr. T. Duncan Rhind, A.R.I.B.A., of Edinburgh, was the architect.

At the Caledonian Station Hotel, Glasgow, a large extension was completed. This comprises a new dining-room 100ft. by 50ft. by 30ft. high, lounge, billiard-room, &c., together with about 130 bed-rooms and sitting-rooms. Mr. James Miller was the architect.

MISCELLANEOUS.

There has been considerable outcry against the mutilation of the trees on the Embankment by reason of the new tramways being laid so close to the pavement. The trees have been "pruned" to allow for the 16ft. clear headway required by double-decked cars. At present the effect of the "pruning" is not particularly noticeable, but when the trees are in leaf again it will be seen how much they have been mutilated.

The demolition of Sir Edward Watkins's ill-fated copy of the Eiffel Tower at Wembley Park, London, N., was commenced in August by a firm of Manchester contractors. The tower was to exceed the Eiffel Tower in height and splendour, but, as a matter of fact, never reached more than 150ft. out of the projected 1,200ft.

At Cleveleys, on the Lancashire coast, near Blackpool, an exhibition of cottages was held during the summer on the lines of that held at Letchworth last year. The first prize of £100 for a detached cottage costing £290 was won by Mr. Albert E. Done, of Blackpool, and the first prize of £100 for a pair of cottages costing £430 by Mr. Q. Mangnall Bluhm, of St. Anne's-on-Sea.

In June the Engineering Standards Committee issued a British standard specification for structural steel for bridges and general building construction.

At the Royal Exchange, London, a fresco of "Modern Commerce," by Mr. Frank Brangwyn, was unveiled in October. It forms a companion fresco to "Ancient Commerce," by the late Lord Leighton.

Transporter Bridge across the Usk, at Newport, Mon.

At the beginning of the year a circular-letter in reference to rural by-laws was sent by the Local Government Board to the rural district councils throughout the country.

BRIDGES, &c.

The new bridge across the Thames at Vauxhall, after having been under construction for 7½ years, was opened on May 26th. It replaces a structure opened in 1816 and finally dismantled in 1899. The abutments and piers are of concrete faced with granite, the superstructure being of steel. There are five spans, the centre span being 150ft. wide. About 4,000 tons of steel were put into the bridge. Much difficulty was experienced with the foundations. The bridge was designed by Mr. Maurice Fitzmaurice and Mr. W. E. Riley, F.R.I.B.A., respectively engineer and architect to the London County Council. Messrs. Pethick Brothers, of Plymouth, were the contractors for the substructure, and Messrs. Charles Wall, Ltd., for the superstructure. The total cost was £437,000.

The new high-level bridge across the Tyne, connecting Gateshead and Newcastle, was opened in July by H.M. the King. There are four spans—two of 300ft., one 232ft. and one 191ft., the total length of the bridge being 1,150ft. The contract ranks as the largest of its kind in this country since the completion of the Forth Bridge. The structure was designed by Mr. C. A. Harrison, chief engineer of the N.E.R., northern division.

The new transporter bridge across the Usk at Newport, Mon., was formally opened on September 12th.

The new lock at Molesey was opened at the beginning of June. With the exception of Teddington, it is the largest lock on the Thames, being 267ft. long and 30ft. wide. The total cost of the work was £14,000.

New sea-defence works and a grand pavilion at Bridlington were completed at a cost of £40,000. The engineering work was under the direction of Mr. E. R. Matthews, A.M.I.C.E., borough engineer, while the architects for the grand pavilion were Messrs. Mangnall & Littlewoods, of Manchester. The reinforcement for the concrete-work is expanded steel.

On December 17th the Bridge House Estates Committee of the City Corporation accepted the tender of Sir William Arrol & Co., for £203,000, for the widening of Blackfriars Bridge, which is to be commenced early next year and will occupy about two years.

A reinforced concrete bridge of 96ft. span at Stanford, Worcestershire, was constructed on the Hennebique system.

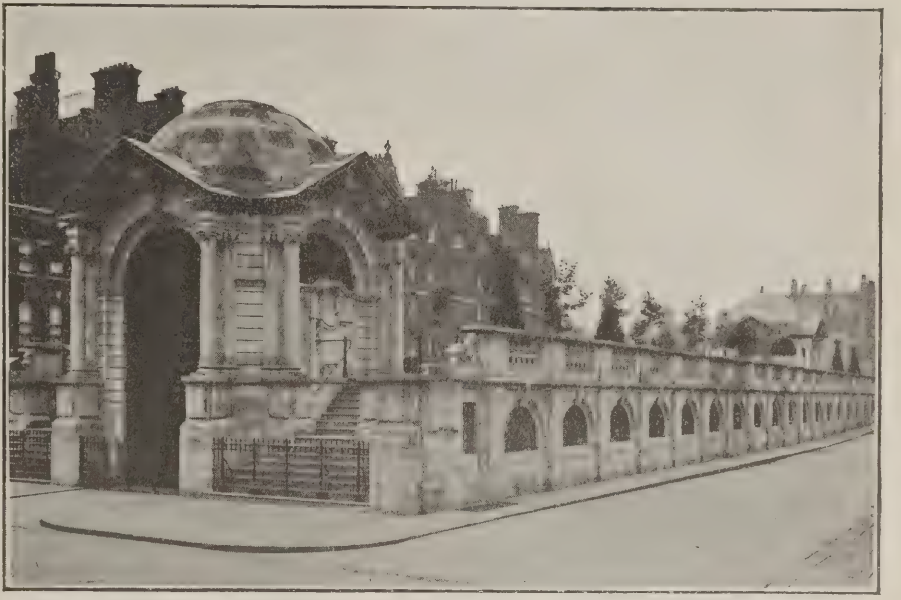
After the close of Earl's Court Exhibition in the autumn, a start was made with the demolition of the Great Wheel, built twelve years ago at a cost of £6,000. The wheel is 280ft. in diameter and weighs 600 tons, and its axle 53 tons. During the course of demolition it was found that many of the rivets had perished, and 20,000 new ones had to be put in before the work could be proceeded with. The wheel is being demolished from the top and equally at both sides, so as to preserve the balance.

The New Vauxhall Bridge. Maurice Fitzmaurice, Engineer; W. E. Riley, Architect, L.C.C.

The New King Edward VII. Bridge at Newcastle-on-Tyne. C. A. Harrison, Chief Engineer, N.E.R., Northern Division.

Steelwork to carry Hammersmith Offices of Great Northern, Piccadilly and Brompton Railway. Drew Bear, Perks & Co., Ltd., Contractors.

Milburn House, Newcastle-on-Tyne. Oliver, Leeson and Wood, and Marshall and Tweedy, Architects. (Concrete floors, reinforced with expanded steel.)



Motor Generator Station, Duke Street, Mayfair, London, W. C. Stanley Peach, F.R.I.B.A., Architect.

New Pavilion and Café at Bridlington. Mangnall and Littlewoods, Architects.

Electricity Generating Station, Sumner Lane, Birmingham. Ewan Harper and Brother, Architects.

Reinforced Concrete Bridge (Hennebique System), Stanford, Worcestershire. Hugh Woodcock, Consulting Engineer.

INSTITUTE AND ASSOCIATION MATTERS.

The year has been notable for the number of distinguished architects who, with the new era inaugurated by the Board of Architectural Education, have joined hands with the Institute and have been elected Fellows. Among these are—Mr. Reginald Blomfield, Mr. Walter Cave, Prof. W. R. Lethaby, Mr. E. L. Lutyens, Mr. Mervyn Macartney, Mr. E. J. May, Mr. Ernest Newton, Mr. E. S. Prior, Mr. Halsey Ricardo, Mr. E. P. Warren, Mr. Walter H. Brierley, Mr. R. S. Lorimer, Mr. E. A. Rickards, Mr. C. R. Mackintosh, Mr. Detmar Blow and Mr. H. Bulkeley Cresswell.

At the exhibition of R.I.B.A. prize designs at the Alpine Gallery in January, two men attracted paramount attention—Mr. Walter S. George, who won the Soane medallion with his splendid design embodying the mansion described in Bacon's essay "Of Building," and Mr. Charles Gascoyne, whose Owen Jones Studentship drawings of Italian architecture were most exquisite in colour and composition. The Tite prize was won by Mr. Alick G. Horsnell, of Chelmsford, the subject being "An Open-Air Swimming Bath"; the Grissell gold medal, for the design of a stone skew bridge, by Mr. George Nott, of Leicester; and the Pugin by Mr. G. Drysdale.

A report on architects' registration has been presented during the year by the committee of the Institute appointed to consider the matter. The report was in favour of a scheme for diplomas granted by the Board of Architectural Education, but no definite decision has yet been reached.

The Architectural Association Rifle Club was inaugurated on October 27th by Major-General Lord Cheylesmore.

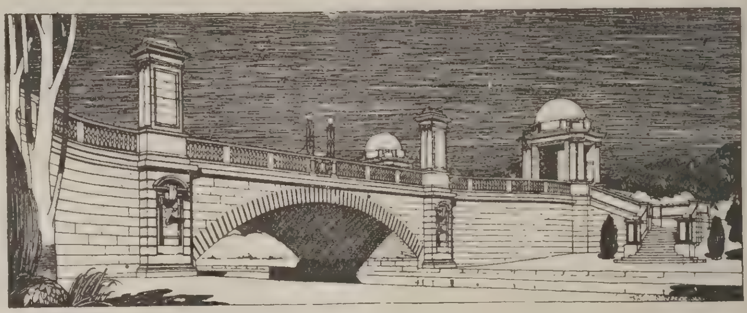
A new Society was formed among architects practising in Gloucestershire, with Mr. F. W. Waller as president.

After some friction, the Ulster Society of Architects decided to terminate its affiliation with the Royal Institute of the Architects of Ireland, and subsequently made application for direct affiliation with the Royal Institute of British Architects.

The fire-resisting floors of the new Manchester Infirmary, for which Mr. Edwin T. Hall is joint architect with Mr. John Brooke, are being constructed of reinforced hollow terra-cotta blocks by the National Fireproofing Co., Ltd., an American combine, who have recently opened a London office.

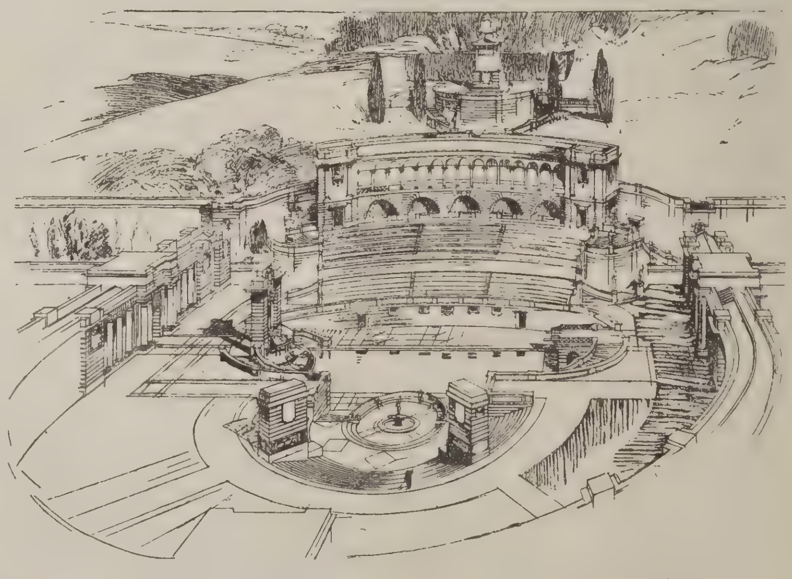
Carl Flohr, the foremost manufacturer of lifts and hoisting appliances in Germany, and one of the old houses in the trade, opened a London office early this year, and is installing automatic push-button lifts of a type novel to the metropolis.

At the Milan Exhibition Messrs. Wailes, Dove & Co. (1906), Ltd., of Newcastle-on-Tyne, were awarded a Gold Medal and Diploma of Excellency for the exhibit of their patent "Bitumastic" enamels, coverings and solution. This firm was also successful in gaining a Gold Medal and Diploma for their exhibits of the same specialities at the Genoa Exhibition held last summer.



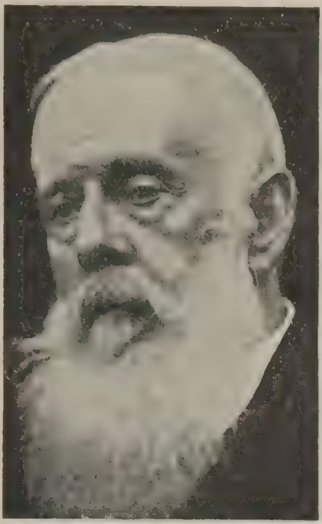
Grissell Gold Medal Design for a Skew Bridge, by G. Nott.

Soane Medallion Design for the Realisation of the Mansion described in Bacon's Essay "Of Building," by W. S. George.



Tite Prize Design for an Open-Air Swimming Bath, by Alick G. Horsnell.

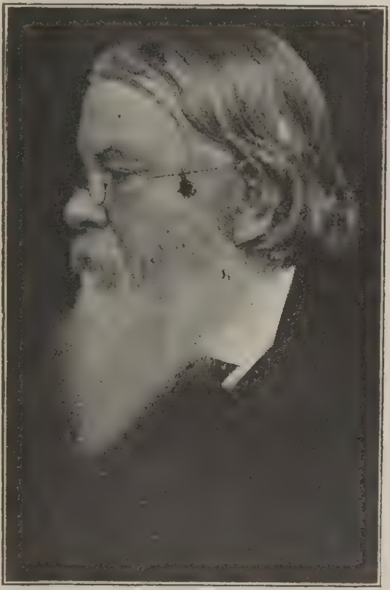
R.I.B.A. PRIZE DESIGNS, 1906.



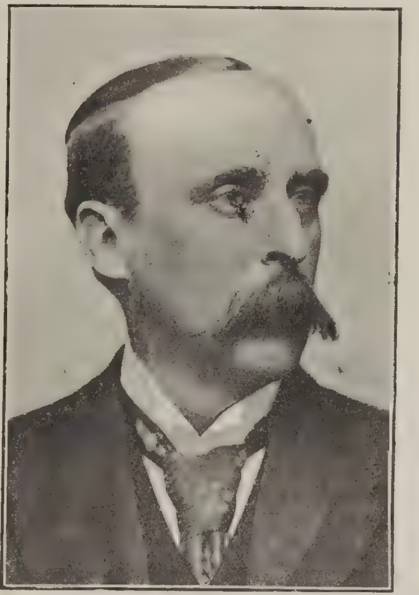
The late J. Henry Christian.

The late John P. Seddon, F.R.I.B.A.

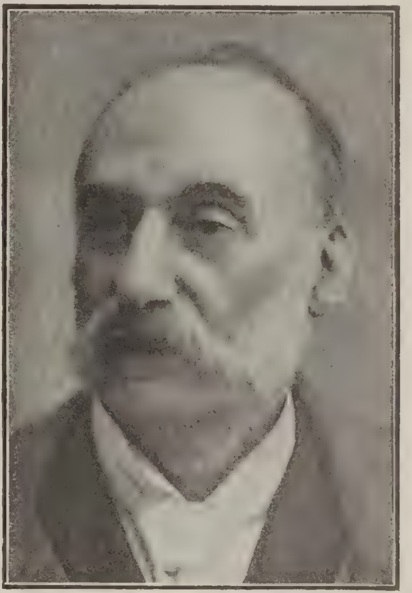
The late Edmund Woodthorpe, M.A., F.R.I.B.A.



The late J. T. Micklethwaite, F.S.A.



The late Bradley Batsford.



The late Edward Salomons, F.R.I.B.A.

OBITUARY, 1906.

Mr. Thomas Garner died in May, aged 67. He did a great deal of church work, both individually and in partnership with Mr. G. F. Bodley, including the fine church at Hoar Cross, Staffs, and St. Augustine's, Pendlebury, near Manchester. He was responsible for most of the firm's work at Oxford, as also for Hewell Grange (Lord Windsor's Worcestershire mansion), and the reredos in St. Paul's Cathedral. The crowning work of his arduous life was the beautiful chancel of Downside Abbey, near Bath, beneath whose roof his body now reposes.

Mr. J. T. Micklethwaite, F.S.A., architect and surveyor to the Dean and Chapter of Westminster Abbey, died on October 28th. In his knowledge of the Abbey Mr. Micklethwaite had no rival, save Thomas Wright, clerk of works, who died some months previously, while as an able architect, and an archæologist of great learning, he was widely known.

Mr. John P. Seddon, F.R.I.B.A., died on February 1st, aged 78. He belonged to the old Gothic school of architects, and made a special study of mediæval architecture.

Mr. Edmund Woodthorpe, M.A., F.R.I.B.A., surveyor for the Northern District of the City of London, died on May 3rd, aged 47.

Mr. Edward Salomons, F.R.I.B.A., the well-known Manchester architect, died on May 12th. A native of London, he went to Manchester early in life and started practice there in 1852. He designed various banks, warehouses, and other buildings in the city, and was much sought after as an architect of large residences. Mr. Salomons was one of the founders of the Manchester Society of Architects, and was twice elected president of that body.

Lieut.-Col. J. Gale, F.R.I.B.A., died in August. He was one of the oldest members of the Institute, and designed some of the first of the London Board Schools.

Mr. Thomas Barnes-Williams died on August 8th. He was senior member in the firm of Barnes-Williams, Ford & Griffin, architects, London.

Mr. Stanford White, partner in the well-known firm of McKim, Mead & White, architects, was shot at a roof-garden theatre in New York on June 25th.

Mr. Bradley Batsford, for many years senior partner in the well-known architectural publishing house on High Holborn, died on July 10th in his 60th year. Not long before, his father died, the founder of the firm. The business is now carried on jointly by the late Mr. Bradley Batsford's brother and by his nephew.

Mr. J. Henry Christian, the well-known architect, died on July 3rd, aged 73.

Mr. H. A. Prothero, M.A., F.R.I.B.A., of Cheltenham, died on November 25th, in his 58th year.

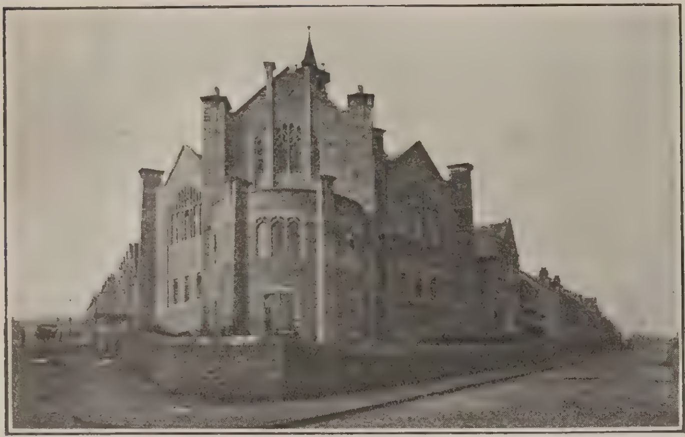
Mr. Ernest Godman, architect, died at Banstead on February 15th. He was the author of works on Norman and Medieval architecture in Essex, and secretary of the Committee for the Survey of the Memorials of Greater London.

Mr John Price, city surveyor of Birmingham, died on March 6th, aged 51.

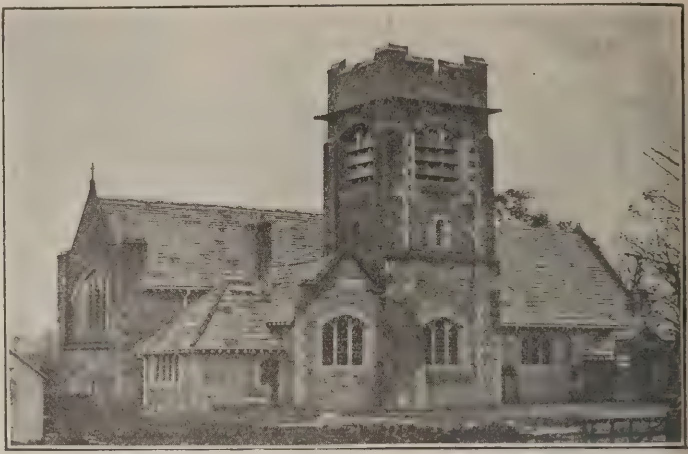
Mr. Charles Long, of the firm of Wylson & Long, theatre architects, London, died in September.

Sir Wyke Bayliss, president of the Royal Society of British Artists, died on April 5th, aged 70. Architecture was the subject of many of his pictures.

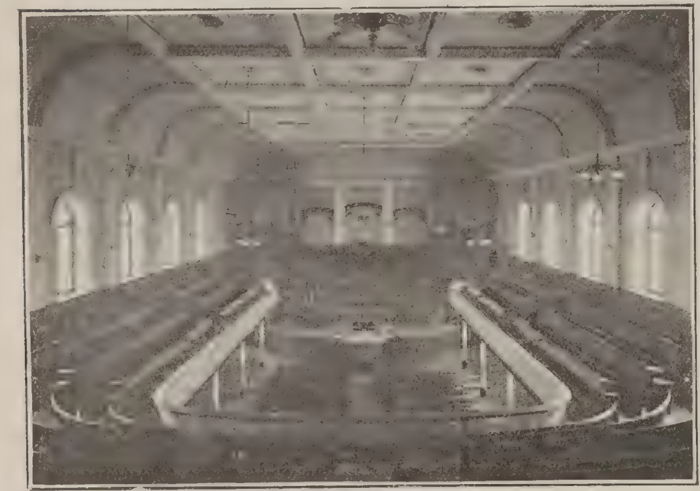
Mr. John Fyfe, the well-known Aberdeen granite merchant, died on July 18th.



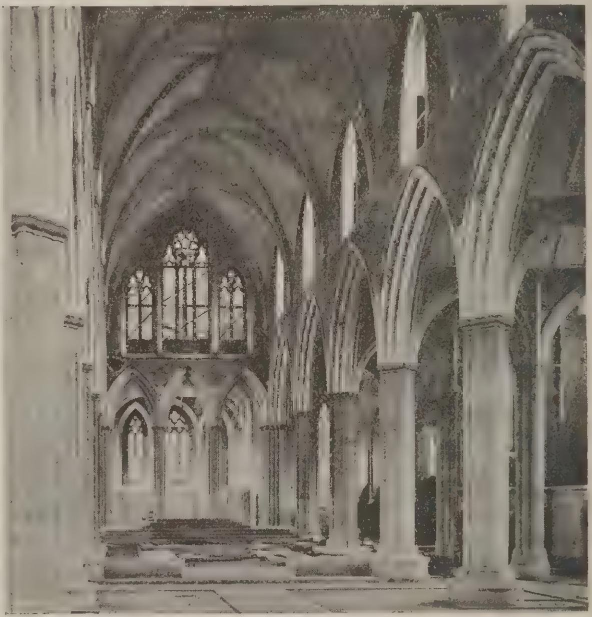
Congregational Church, Crookes, Sheffield. W. J. Hale, F.R.I.B.A., Architect.



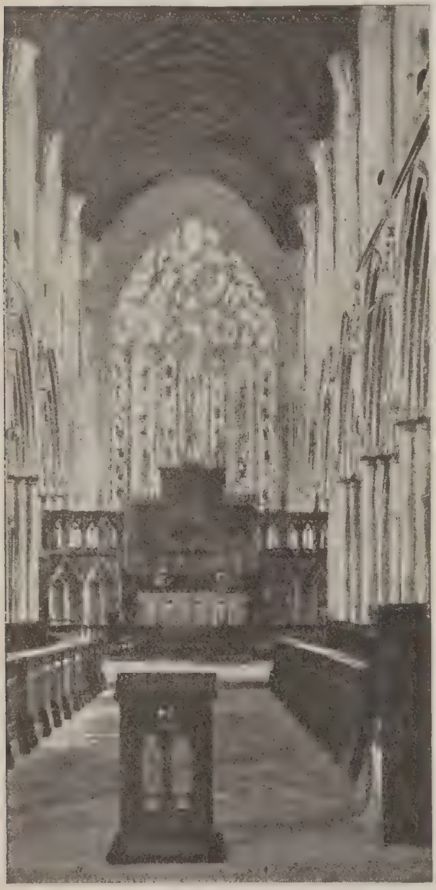
Hellifield Church, Yorks. Connon and Chorley, Architects.



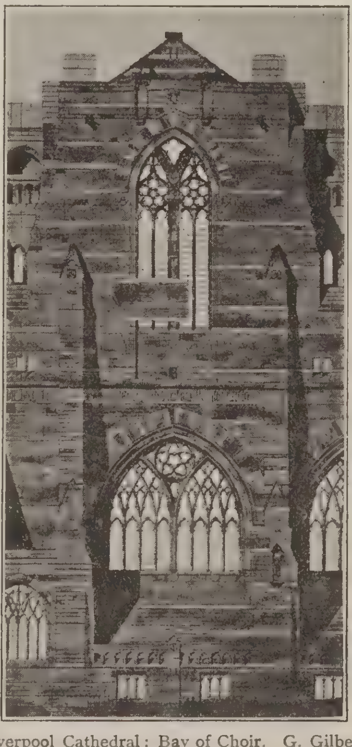
New Central Hall, Commercial Street, Newport, Mon.
Habershon, Fawckner and Co., Architects.



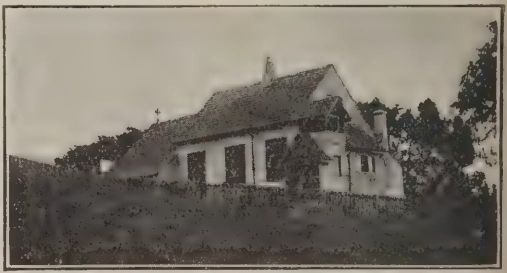
All Saints, Tooting Graveney. Temple Moore, Architect.



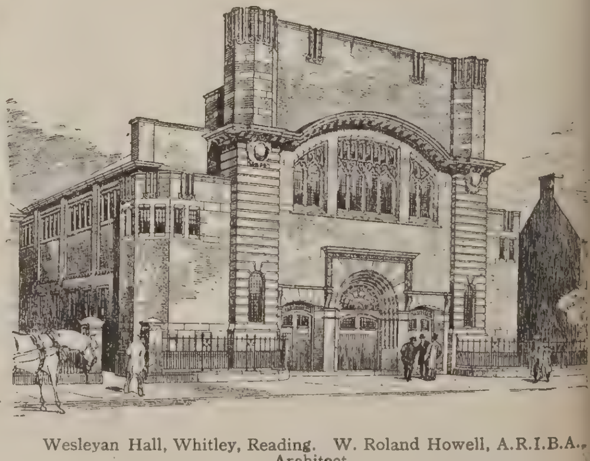
Selby Abbey, Yorks.



Liverpool Cathedral: Bay of Choir. G. Gilbert Scott and G. F. Bodley, Joint Architects.



Mission Church, Cleeve Hill, Cheltenham. E. D. Hoyland, Architect.



Wesleyan Hall, Whitley, Reading. W. Roland Howell, A.R.I.B.A., Architect.

Group on Birmingham Soldiers' Memorial.

MEMORIALS.

A beautiful memorial to the Birmingham men who fell in the South African War was unveiled in June, in Cannon Hill Park, Birmingham. Mr. Albert Toft designed it.

A statue of Charles Kingsley was unveiled at Bideford on February 7th.

A memorial to the late Marquis of Salisbury, in front of the entrance gates to Hatfield House, was unveiled in the autumn. Mr. George Frampton, R.A., was the sculptor.

At Liverpool the Queen Victoria Memorial at the top of Lord Street, after having been completed for some time, was unveiled by Princess Louise on September 27th. It is a well-designed memorial with the seated figure of the Queen below a dome supported by sixteen Ionic columns and crowned by a winged figure of Fame. Mr. C. J. Allen was the sculptor, and Prof. F. M. Simpson and Messrs. Willink and Thicknesse were the joint architects.

Soldiers' Memorial, Cannon Hill Park, Birmingham.
Albert Toft, Sculptor.

CHURCHES AND CATHEDRALS.

St. Columba's R.C. Church, Drumcondra, Dublin, has been erected from designs by Messrs. Ashlin and Coleman.

At Portobello, Edinburgh, a Roman Catholic church has been erected from designs by Mr. J. T. Walford.

A Congregational church has been erected at Crookes, Sheffield, from designs by Mr. W. J. Hale. The plan is octagonal, with transepts, &c.

On November 17th the new tower and spire of Emmanuel Church, Woodhouse Lane, Leeds, was dedicated. Mr. H. S. Chorley was the architect.

At Manselton, Swansea, the new Church of St. Michael and All Angels was consecrated at the end of January. Mr. Bruce Vaughan, of Cardiff, was the architect.

The new chapel in St. Paul's Cathedral was dedicated in June. It is on the south side of the nave and was originally the Wellington Chapel. Mr. Somers Clarke was the architect.

At the Catholic Apostolic Church in Glasgow a north aisle, south and west porches, and other additions were erected from designs by Messrs. Salmon & Son & Gillespie. The original church was built from sketch designs by Pugin.

On July 7th the Bishop of Southwark consecrated the Church of All Saints, Tooting Graveney, built at a cost of £50,000 from designs by Mr. Temple Moore. The plan includes a nave and choir of seven bays, with Lady Chapel beyond.

On October 20th a disastrous fire occurred at Selby Abbey, the nave and choir roofs, pews and other woodwork being destroyed, the reredos demolished, and the stonework generally spalled and damaged. The fire was due to a light left by some workmen engaged in installing a new organ. The damage done has been estimated at £50,000. A scheme of restoration has been drawn up by Mr. J. Oldrid Scott, architect to the Abbey.

On January 31st Christ Church, Down Street, Mayfair, was gutted by fire. The greater part of the roof (which was lined with matchboarding and covered with felt) was destroyed and the woodwork more or less consumed. The outbreak was due to a defect in the heating apparatus.

Considerable anxiety was caused through the subsidences at the eastern end of Winchester Cathedral. Extensive shoring had to be adopted, and subsequently it was found necessary to commence underpinning in order to make the foundations satisfactory. The work is being carried out by Mr. Colson, the cathedral architect, in conjunction with Mr. T. G. Jackson, R.A.

Towards the end of the year considerable attention was directed to St. Paul's Cathedral by reason of the statement made that a serious further settlement had taken place at the south-west corner. The Dean and Chapter appointed a committee of inspection (consisting of Mr. Collcutt, Mr. Belcher and Sir Aston Webb) to go into the matter with the cathedral architect, Mr. Mervyn Macartney, and the cathedral engineers, Messrs. Barry, Leslie & Co. The report of this committee has not yet been published, but in December the Dean and Chapter announced that they had given permission to the London County Council to construct the proposed deep-level sewer beneath St. Paul's Churchyard.

Queen Victoria Memorial, Lord Street, Liverpool.
F. M. Simpson, and Willink and Thicknesse, Architects. C. J. Allen, Sculptor.

On July 17th the Duke of Connaught laid the corner-stone of the chapter-house of Liverpool Cathedral. This forms part

War Memorial, St. Paul's School, Hammersmith.

Sir Lawrence Alma-Tadema, R.A.
(Royal Gold Medallist, 1906).

of the first portion of the building now in process of erection—comprising, in addition, the transepts with their twin towers, the choir, vestries and Lady Chapel. This first portion is estimated to cost £240,000. The choir will not be ready for service for ten or twelve years, but the Lady Chapel is to be completed in four years. The nave of the cathedral will be built after the first section has been finished. The joint architects are Mr. G. Gilbert Scott and Mr. G. F. Bodley, the contractors being Messrs. Morrison & Sons, of Liverpool. In February it was announced that a set of choir stalls would be presented to Liverpool Cathedral by Mr. S. J. Waring (of Waring & Gillow, Ltd.) and his sons, in commemoration of the firm's long connection with Liverpool. These stalls will be carved in Messrs. Waring & Gillow's workshops, from designs by Mr. Bodley. The cost will be nearly £8,000.

At Cleeve Hill, Cheltenham, a mission church was erected from designs by Mr. E. D. Hoyland. The construction is of timber framing with "Frazzi" filling for walls, rough-cast externally, with cement dado inside.

At Westminster Cathedral the new baldachino and the canopy for the Archbishop's throne were completed, the architects being Messrs. J. F. Bentley and Son.

PERSONAL.

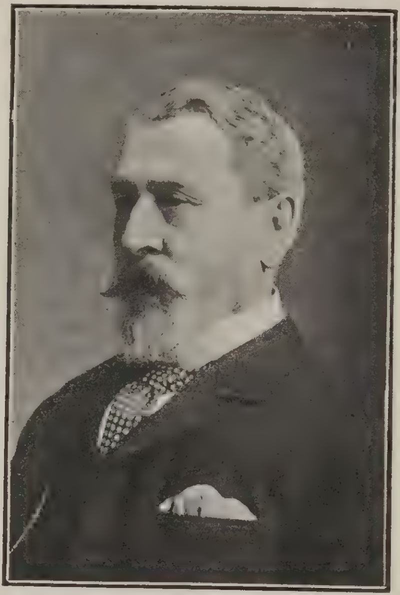
Sir Aston Webb, R.A., was awarded the first Gold Medal of the American Institute of Architects.

Sir Lawrence Alma-Tadema, R.A., was awarded the Royal Gold Medal for 1906.

Mr. T. E. Collcutt was elected president of the R.I.B.A. in June. Later he was elected a *membre d'honneur* of the Société Centrale d'Architecture de Belgique.

Mr. R. S. Balfour was elected president of the Architectural Association, in succession to Mr. E. Guy Dawber.

Mr. Reginald Blomfield, A.R.A., was appointed Professor of Architecture at the Royal Academy in succession to Mr. George Aitchison, R.A. Mr. Blomfield was also elected an Honorary Fellow of Exeter College, Oxford.



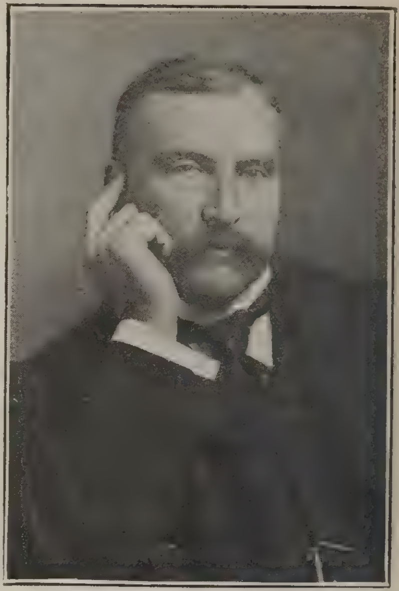
T. E. Collcutt,
President of the Royal Institute of British Architects.

R. S. Balfour, F.R.I.B.A.,
President of the Architectural Association.

Sir A. Brumwell Thomas, F.R.I.B.A.

Mr. A. Brumwell Thomas, F.R.I.B.A., architect of the new City Hall at Belfast, and the new Town Hall at Woolwich, was included among the new knights in the November birthday honours list.

At the Milan Exhibition Mr. E. T. Hall was awarded a gold medal for hospital design, and Mr. H. Percy Adams a gold medal for architectural works.



Mervyn Macartney, F.R.I.B.A.,
Architect to St. Paul's Cathedral.

Mr. R. Phenè Spiers retired from the mastership of the Architectural School at the Royal Academy.

Mr. W. D. Caröe was elected Master of the Worshipful Company of Plumbers.

Mr. A. E. Pridmore was re-elected president of the Society of Architects.

In January Mr. Pomeroy, the well-known sculptor, was elected an A.R.A.

Mr. D. S. MacColl was appointed keeper of the Tate Gallery, in succession to Sir Charles Holroyd, now Director of the National Gallery.

The first gold medal of the Institute of British Decorators was presented to Sir William Richmond on November 26th, in consideration of his work at St. Paul's Cathedral.

At the end of February a complimentary dinner was given to Prof. Henry Adams by students who had worked under him at the City of London College, where he was professor of engineering for 35 years.

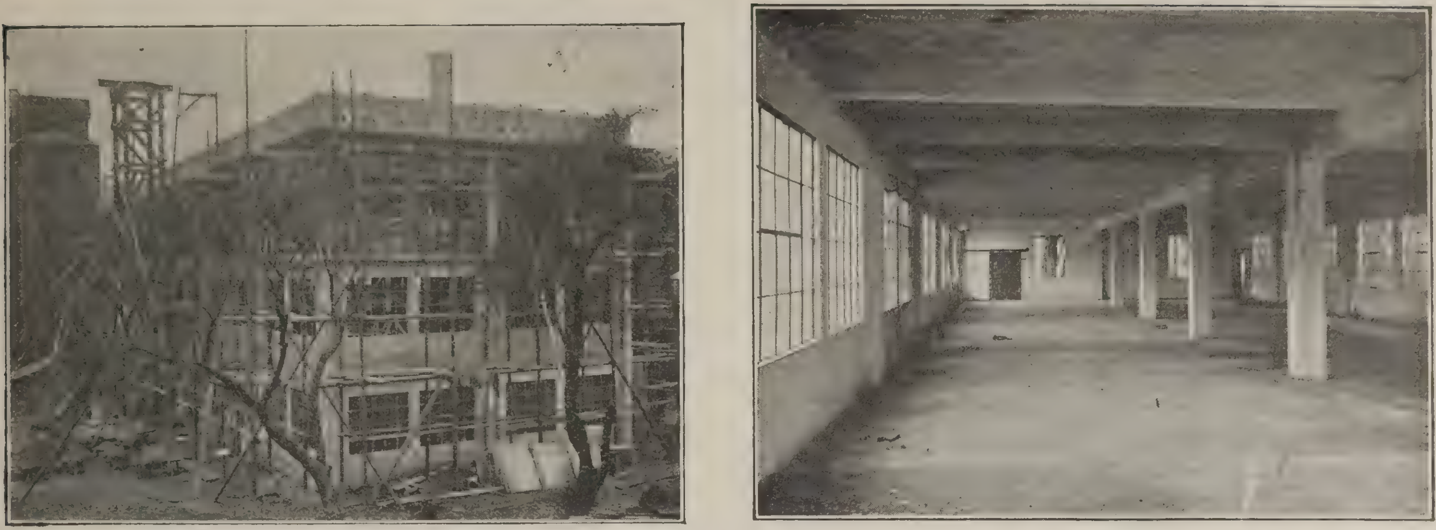
Among those returned to Parliament in the General Election last January was Mr. T. B. Silcock, of the firm of Silcock and Reay, architects, of Bath.

Mr. G. F. Bodley, R.A., went to Washington in November in order to consult the authorities about the Protestant Episcopal Church which is proposed to be built on Mount St. Albans, Washington. This will be the largest cathedral in the United States.

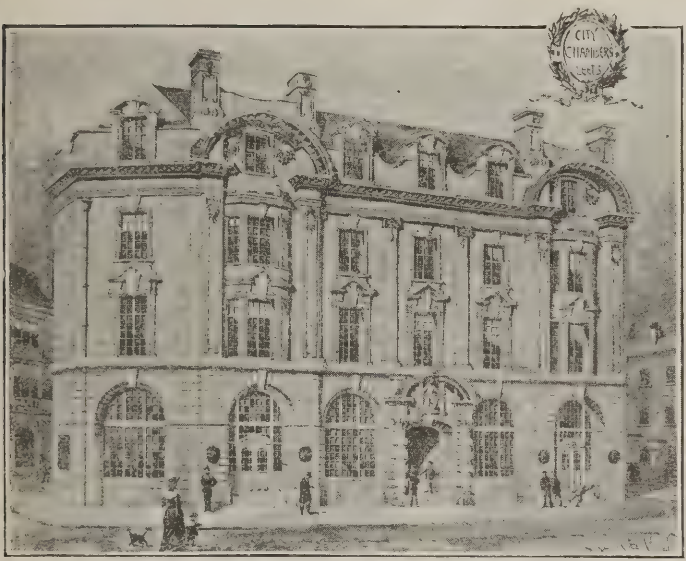
Mr. Mervyn Macartney, F.R.I.B.A., was appointed consulting architect to the Dean and Chapter of St. Paul's Cathedral, *vice* Mr. Somers Clarke, F.S.A., resigned.

Prof. W. R. Lethaby was appointed surveyor of the fabric of Westminster Abbey, and Mr. Arthur G. Wallace was appointed assistant surveyor.

The seventh International Congress of Architects was held in London in July. There was a large attendance of delegates from all over the world, and many papers on architectural and kindred subjects were read at the numerous meetings, and resolutions passed.



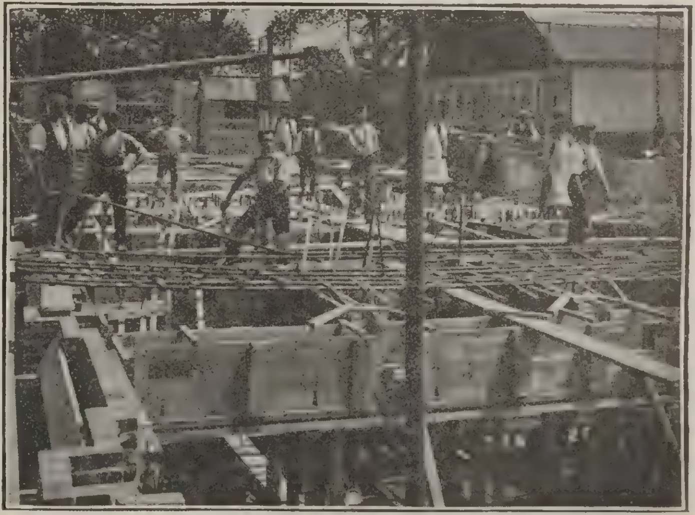
Reinforced Concrete Factory (Kahn System) for Hudson Scott and Sons, Ltd., Carlisle. H. W. Taylor, A.M.I.C.E., Engineer.



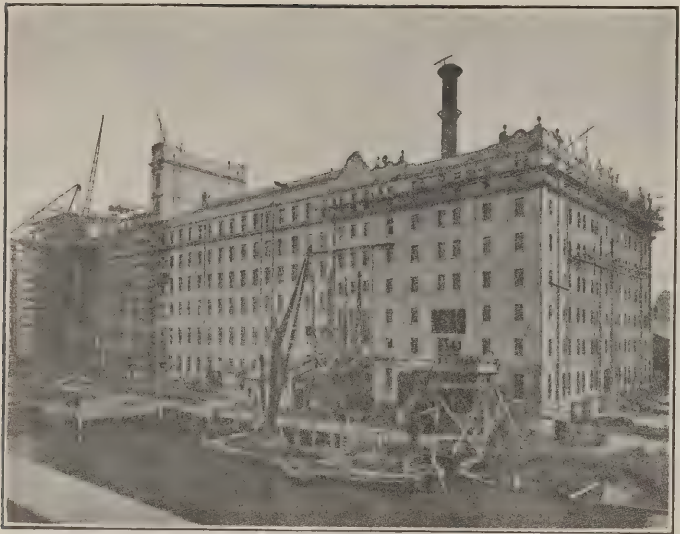
City Chambers, East Parade, Leeds. Perkins and Bulmer, Architects.
Floors of Reinforced Concrete, Kahn System.

Nos. 1—4, Lombard Street, London, E.C. Dunn and Watson, Architects.
Reinforced Concrete Beams and Landings, Kahn System.

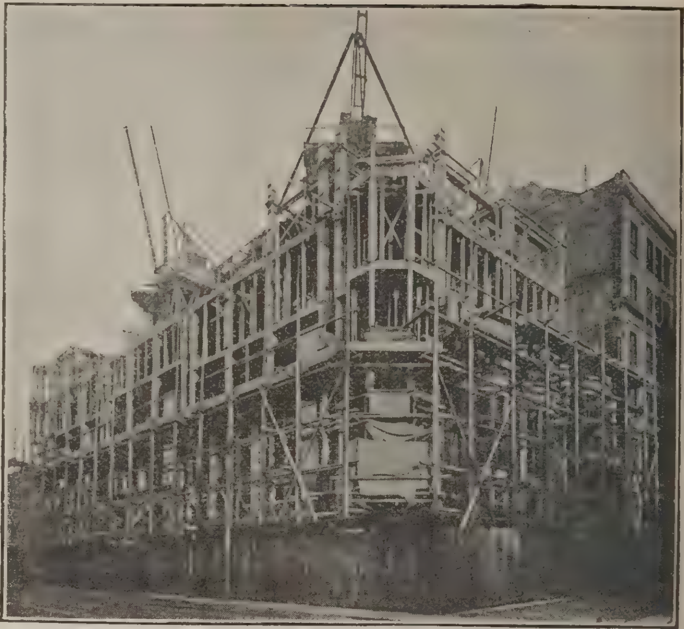
Reinforced Concrete Floor (Kahn System), Whitbread's Brewery, London, E.C.
W. Dixon, Architect.



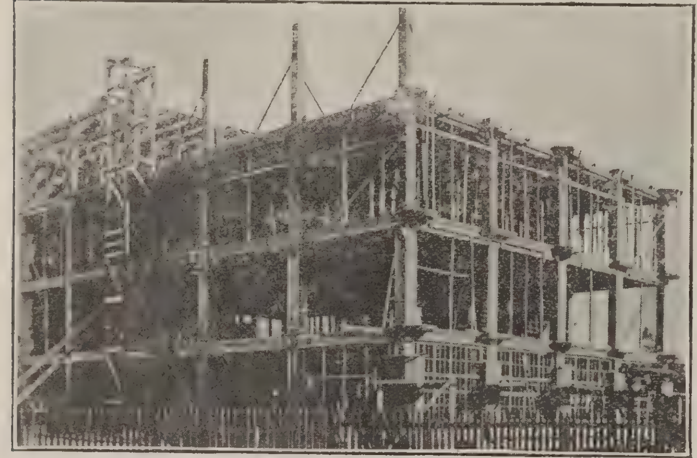
Reinforced Concrete Warehouse Floor, King Street, Norwich.
Morgan and Buckingham, Architects. E. P. Wells, Engineer.



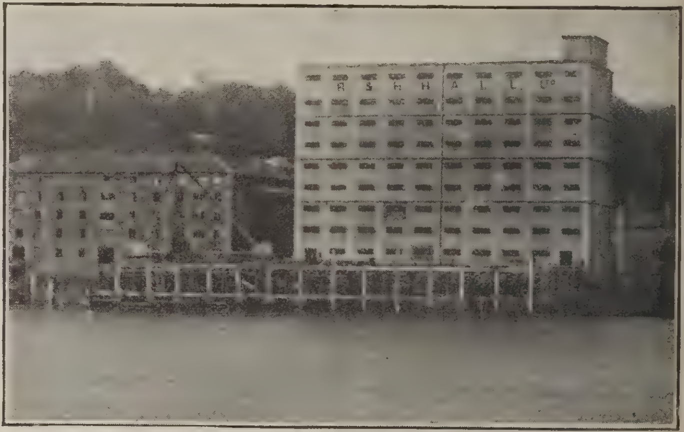
Reinforced Concrete Flour Mills (Hennebique System) at Victoria Docks, London, for Vernon & Sons. William Cubitt, Contractor.



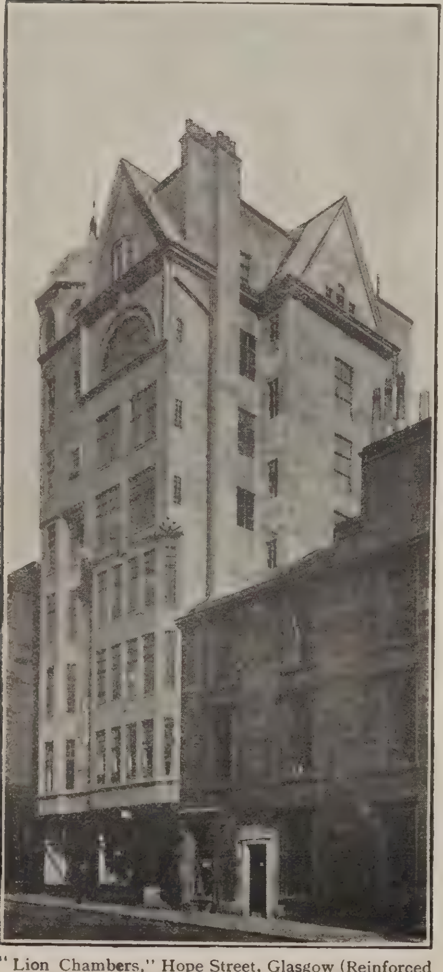
Reinforced Concrete Warehouse (Hennebique System) for the Colne Co-operative Society, Colne.



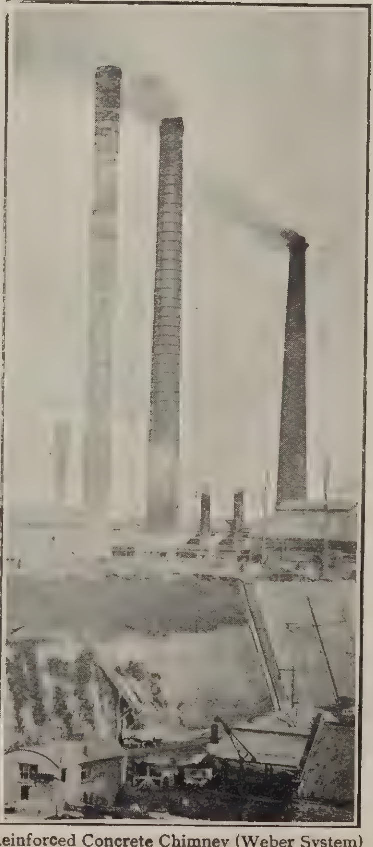
Reinforced Concrete Factory (Hennebique System) at York, for Rowntree & Co., Ltd.



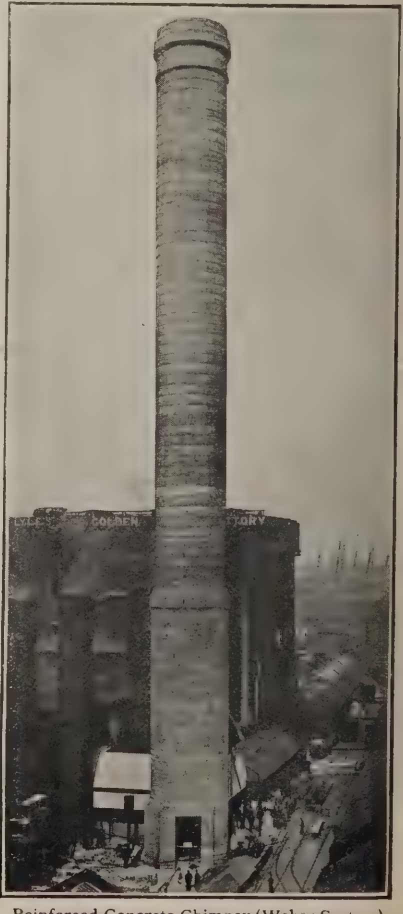
Reinforced Concrete Grain Warehouses (Hennebique System) at Waterford for R. & H. Hall, Ltd. W. Friel, Harbour Engineer.



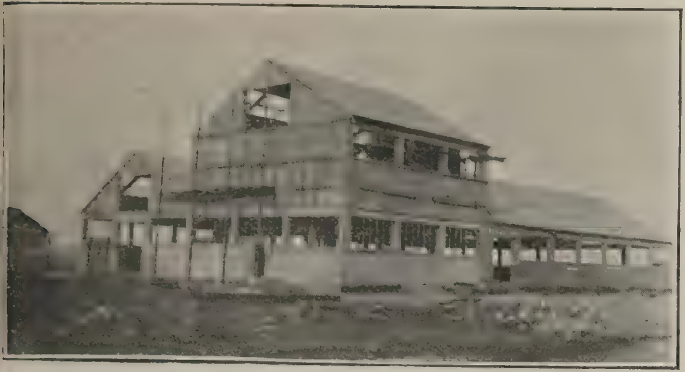
"Lion Chambers," Hope Street, Glasgow (Reinforced Concrete on Hennebique System). Salmon & Son and Gillespie, Architects.



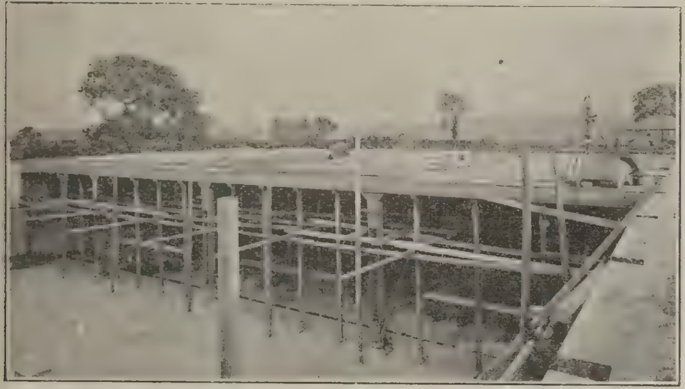
Reinforced Concrete Chimney (Weber System) at Associated Portland Cement Manufacturers, Works at Northfleet.



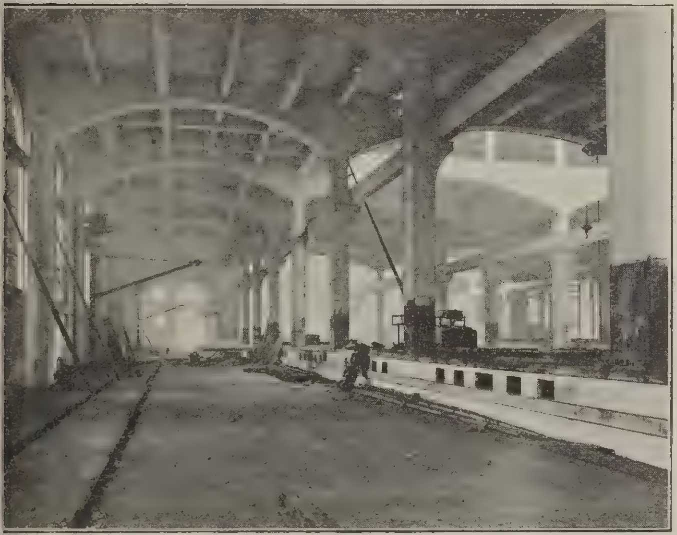
Reinforced Concrete Chimney (Weber System) at Lyle's Refinery, Victoria Docks, London.



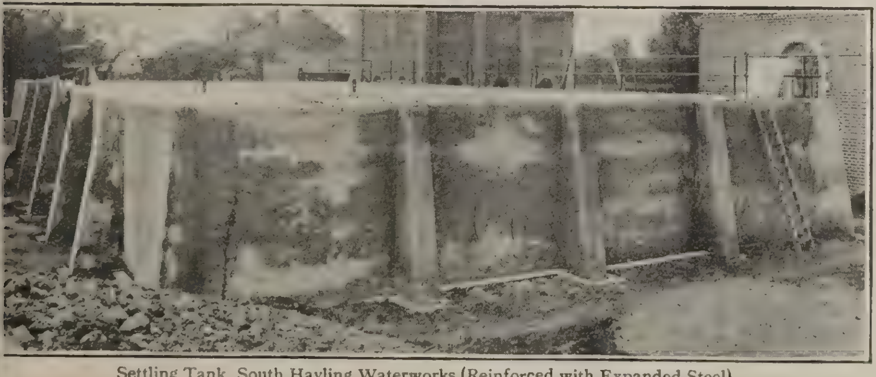
Reinforced Concrete Warehouse (Coignet System) at Rainham, Essex, for J. C. and J. Field, Ltd. Scott, Hanson & Fraser, Architects.



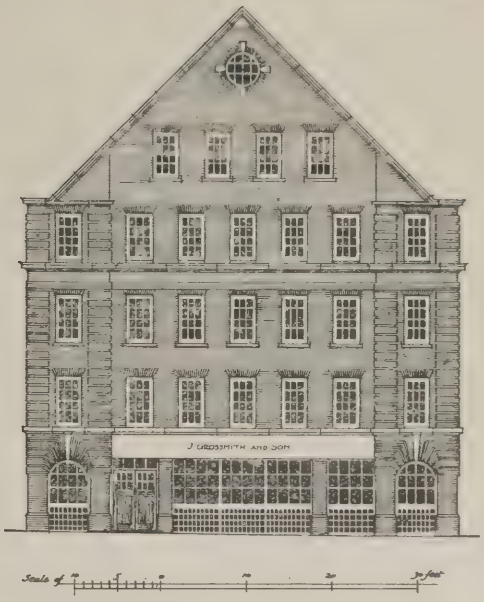
Concrete Reservoir, Downside Abbey (Cover Reinforced by Indented Bars).



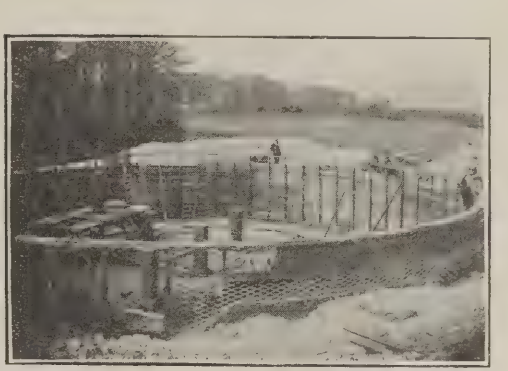
New Bridge Street Goods Station, Newcastle-on-Tyne. (Reinforced Concrete on Hennebique System.)



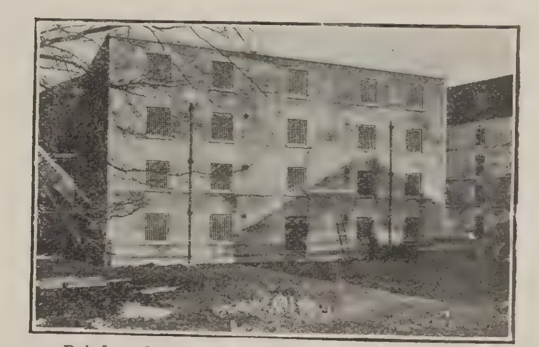
Settling Tank, South Hayling Waterworks (Reinforced with Expanded Steel)



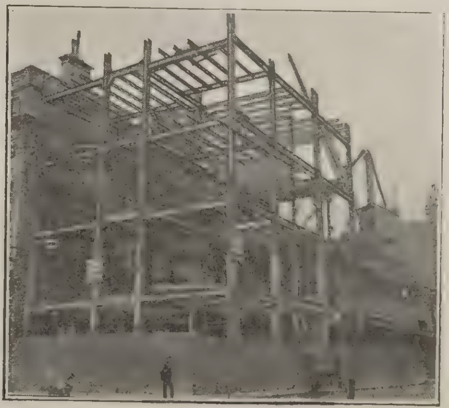
Building in Duke's Head Passage, London, E.C. (Reinforced Concrete Floor and pillars on Coignet System.) H. A. Saul, A.R.I.B. ., Architect.



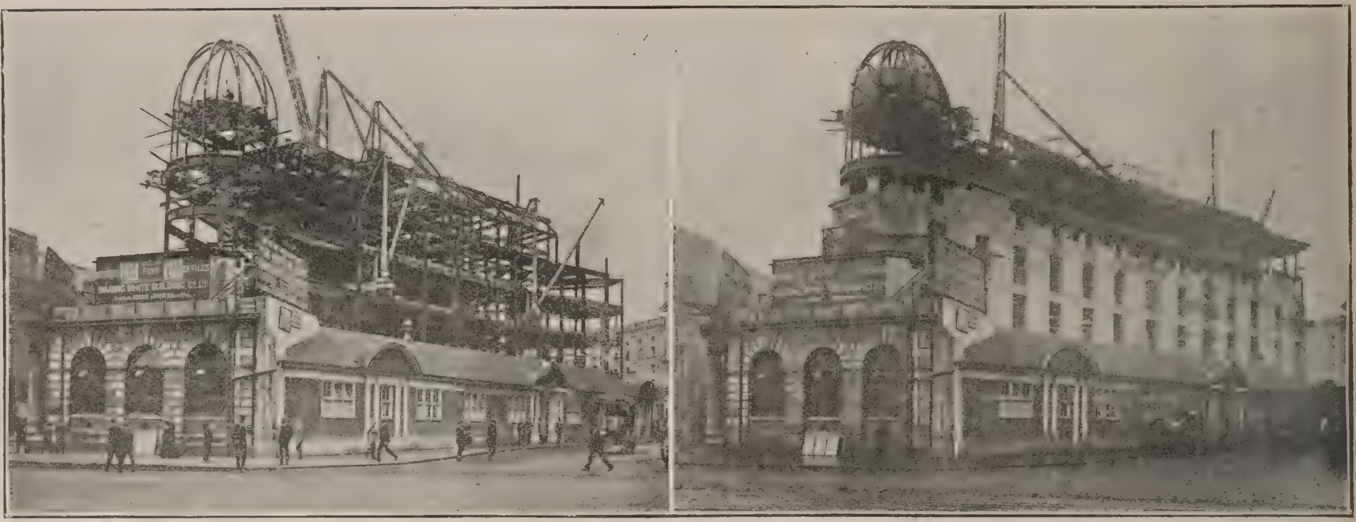
Reinforced Concrete Circular Tank (Expanded Metal System), at Hursley Park, near Winchester. A. Marshall Mackenzie & Son, Architects.



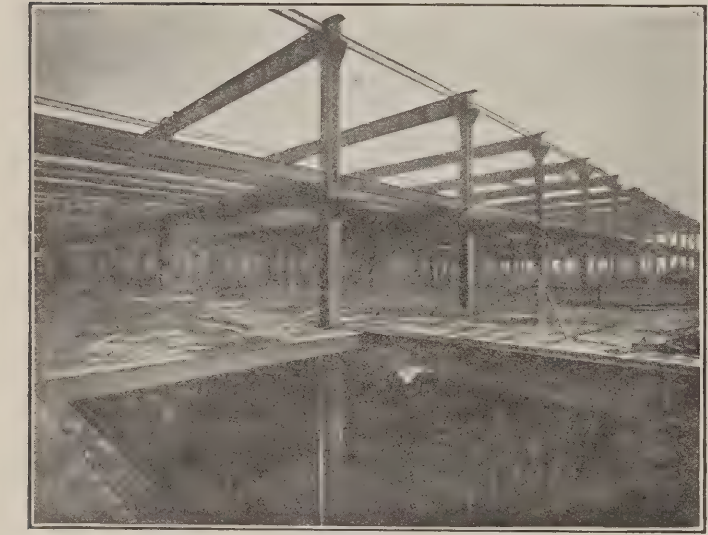
Reinforced Concrete Malting Store, (Expanded Metal System), at Beamish & Crawford's Brewery, Cork. L. A. McDonnell, M.R.I.A.I., Architect.



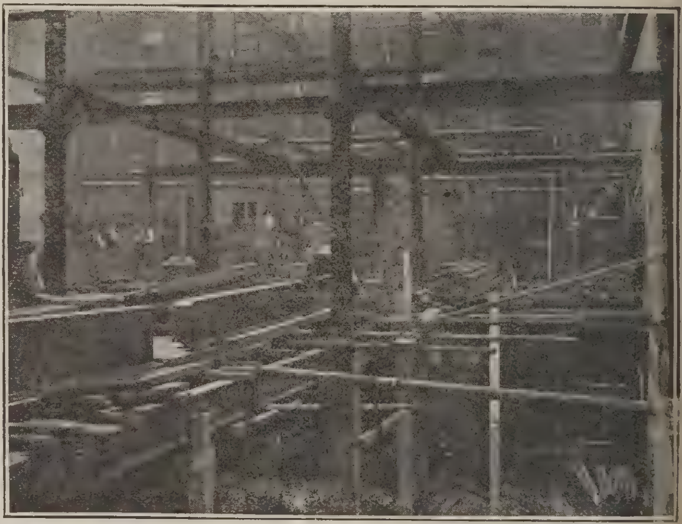
Gloucester House Flats, Piccadilly, London. Collcutt & Hamp, Architects. Steelwork by Drew-Bear, Perks & Co, Ltd.



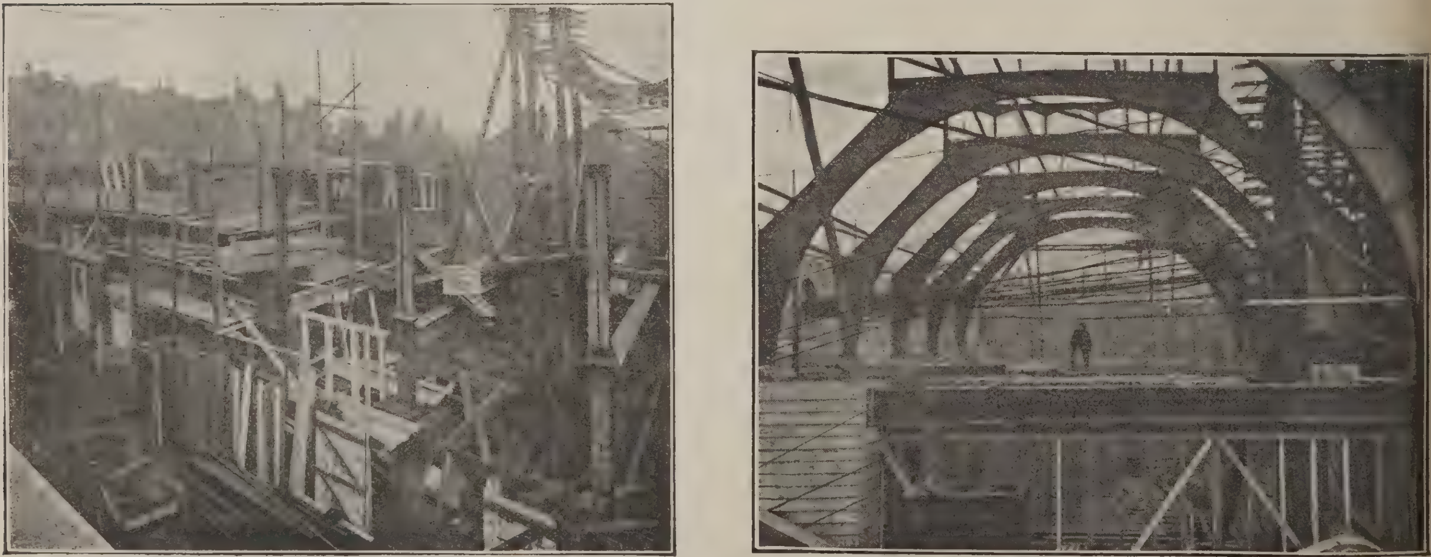
The "Morning Post" Building, Aldwych, London. Mewès & Davis, Architect. S. Bylander, Engineer for Steelwork. (Reinforced Concrete Floors on Columbian System External Norwegian Granite facing by A. & F. Manuelle, Ltd.)



College Goods Station, Glasgow, for North British Railway. Reinforced Concrete Floors on Expanded Metal System. (Steelwork by Redpath, Brown & Co., and the Brandon Bridge Building Co.

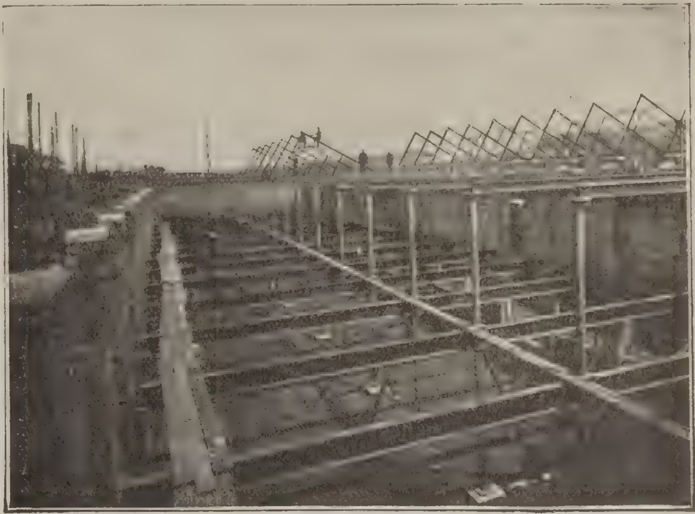


Messrs. Sanderson's New Premises, Berner's Street, London. L. A. Hayes. Architect (Steelwork by D. G. Somerville & Co.)



National Telephone Co.'s Premises, Paddington. Leonard Stokes, F.R.I.B.A., Architect (Steelwork by D. G. Somerville & Co.)

Aberdeen Theatre in course of construction. F. Matcham & Co., Architects (Steelwork by Drew-Bear, Perks & Co., Ltd.)



New Enfield Cycle Co.'s Works at Redditch in course of construction (Steelwork by the St. Pancras Ironwork Co., Ltd.).

REINFORCED CONCRETE.

The use of reinforced concrete for architectural and engineering structures has made great strides in the past year, and a number of important contracts have been completed, while a still larger number have been settled and are in course of construction or are to be started immediately. Undoubtedly the most important contract decided is that for the extension to the General Post Office in Newgate Street, London, but this work has not yet been begun.

We publish views of some of the most important jobs.

Two of the largest American systems made their appearance in the English market this year—namely, the Kahn Trussed Bar and the Indented Bar. Both have made substantial progress, while the older established specialists have done much better than formerly.

The Kahn system has made remarkable progress since commencing last February, due to the energy of Mr. Moritz Kahn, the European representative, whose portrait is published on this page. Mr. Kahn was born in December, 1879, at Berlin, Germany, was taken to America in 1881, and received his engineering training in the University of Michigan, U.S.A.

Below we give lists of a few of the most important contracts in the various systems completed or settled upon this year.

The Trussed Concrete Steel & Co. (Kahn System).

Factory, Carlisle, for Hudson, Scott & Sons, Ltd. H. W. Taylor, A.M.I.C.E., engineer.
Coal Hopper, Bevan's Cement Works, Northfleet. C. P. Taylor. A.M.I.C.E., engineer.
Extensions to Town Quay, Southampton. A. Cooper Poole, A.M.I.C.E., engineer.
Administrative Block, Peter Brotherhood's Works, Walton, Peterborough.
Bridges at Lucker and Lilburn, Northumberland. H. W. Taylor, A.M.I.C.E., engineer.
Arching, Cobwall Covering, Blackburn. W. Stubbs, A.M.I.C.E., engineer.
Coal Hopper and Floors, Cement Works, Swanscombe, Kent. C. P. Taylor, A.M.I.C.E., engineer.
Cooling Tower, Central London Railway, Shepherd's Bush. H. F. Parshall, M.I.C.E., engineer.
Rainwater Tank, Leiston, Suffolk, for R. Garrett & Sons, Ltd.
Wall, Felixstowe Mills, Felixstowe. Brown and Burgess, architects.
Floor, Whitbread's Brewery, London, E.C. W. Dixon, architect.
Foundations, Reservoir, Chilcompton.
Floors, City Chambers, East Parade, Leeds. Perkins and Bulmer, architects
Roof, Chronic Block, Norwich City Asylum. A. Collins, M.I.C.E., engineer.
Beams and Landings, 1-4, Lombard-street, London, E.C. Dunn and Watson, architects.
Strengthening Tar Tank, Poole, Dorset. H. W. Woodall, engineer.
Floors, roof, etc., East Anglian Cement Works, Shepreth, Herts
Decking, Ryde Pier, Ryde, I.W., for L.B. & S.W. Joint Railway Companies.
Floors and Roof, 54-55, Berners-street, London, W. L. A. Hayes, A.R.I.B.A., architect.
Beams, Bournemouth Gas & Water Co., Bournemouth. H. W. Woodall, engineer.
Floor and Kiln Roof, Sanitas Works, Limehouse, London, E. A. T. Bolton, A.R.I.B.A., architect.
Public Baths, Lime-grove, Shepherd's Bush, for the Hammersmith Borough Council. J. E. Franck, A.R.I.B.A., architect.
Lintels, Scottish Provident Building, Glasgow.
Floor, Factory, Goldsmith-row, E. Horace Helsdon, F.R.I.B.A., architect.
Battery Roof, R.E. Forth Defences, Kinghorn, N.B.
Roof Beams, Roker Church, Sunderland. A. Randell Wells, architect.
Floors, Horsforth Hospital, Leeds. A. Walker & Sons, contractors.
Floors, Co-operative Stores, Tamworth. F. Andrews, A.R.I.B.A., architect.
Beams, Blyth Lighthouse, Northumberland. A. Watt Sandemann, engineer.
Foundations, Union Bridge Widening, Aberdeen. G. R. G. Conway, engineer.
Bridge Widening, Broadheath, U.D.C., Broadheath. Maxwell & Tuke, engineers.
Floors and Roof, Repository, Rye, Sussex. Philip Tree, F.R.I.B.A., architect.
Floors and Beams, Leeds Forge, Leeds. Perkins and Bulmer, architects.
Factory, Histon, Cambs, for Chivers & Sons.
Foundations, Shops, Belfast. W. D. R. Taggart, engineer.
Foundations, Factory, Purfleet, for the Vacuum Oil Co., Ltd.

Stuart's Granolithic Stone Co., Ltd. (E. P. Wells's System).

Hull Town Hall, Law Courts Section.
Newcastle Grammar School.
Floor for Oil Mills, Sculcoates, Hull.

Moritz Kahn.

"Dundee Courier" Annexe, Dundee.
Japanning Stoves and Roof, Beeston.
Floors, Staircases, &c., 103-104, Cheapside, E.C.
Columns, Floors, Staircases, &c., Rochester Technical Institute.
Warehouse Floors, Staircases, &c., High-street, Manchester.
Technical Institute, Bury St. Edmunds.
Grammar School, Maldon, Essex.
Technical Institute, Erith.
Warehouse Floors, Barking.
Schools, Haverhill, Suffolk.
Chocolate Factory, Galleywall-road, S.E.
Stables, Holborn.
Tank, Mansion House Chambers, E.C. (10ft. head of water).
Tank and Roof to carry Railway Trucks, Beeston.
Floors, &c., Beeston.
Floors, Royton Schools.
Chocolate Factory, Portobello.
Private House, Little Hampden, Bucks.
Factory Floors, &c., Venesta, Ltd., Millwall, E.
Furniture Depository, York-road, N.
Davidson-road Schools, Croydon.

F. Bradford & Co. (E. P. Wells's System).

Star Laundry, Hackney.
Warehouse Floor, King-street, Norwich (5cwt. per square foot, 28ft. span).
Retaining Walls, (34ft. high), Floors, Staircases, &c., Norfolk County Council, Shire Hall, Norwich.
Tank for Messrs. Schweppes, Kensington (8ft. water).
Floors, &c., Hackney Furnishing Co.

Coignet System.

Warehouses, Foundations for Boilers, Economiser, and Gas Engines, Coal Bunkers, Two Bridges, Slipway, &c., at Rainham, Essex, for J. C. & J. Field, Ltd. Scott, Hanson, & Fraser, architects.
Shop Premises, Lyme-street, West Hartlepool, for M. Robinson & Sons, Ltd. Barnes and Burton, architects.
Floors, Pillars, &c., Premises in Duke's Head Passage, London, E.C., for J. Grossmith, Son & Co., wholesale perfumiers. H. A. Saul, A.R.I.B.A., architect.
Floors, Pillars, &c., Extension to Goodman-street Works, Birmingham. Buckland and Farmer, architects.
Strong Room and Partition Walls, Hatton Garden, London, E.C., for Stewart Dawson. Niven and Wigglesworth, architects.
Strong Room, Southampton, for Messrs. Thorneycroft. Scott, Hanson, and Fraser, architects.
Strong Room, St. James's-street, London S.W., for the London & County Banking Co., Ltd. Thompson and Walford, architects.

Patent Indented Steel Bar Co., Ltd. (Johnson System).

Floors, Waldorf Hotel, Aldwych, London. A. Marshall Mackenzie & Son, architects.
Reservoir, Downside Abbey (600,000 gallons).
Factory for Coventry Ordnance Co., Glasgow.
Foundations of Factory, Northfleet, for Wall-paper Manufacturers, Ltd.
Foundations of Chimney at Bootle, Lancs.

Homan & Rodgers (Waved Tee Bar).

Floors at: Brentwood Asylum, Isleworth; Workhouse Infirmary, Coventry; Daybrook Laundry, Nottingham; Welsh C.M. Chapel, Hammersmith; Talbot Hotel and Shops, Wrexham; Brunswick Council School, Cambridge; Nurses' Home, Rotunda Hospital, Dublin; Savings Bank, Preston; Workhouse Infirmary, Otley; School of Art, Burslem; Holmbrook Hotel, Preston; Warehouse, Compton Mills, Leek; Doubling Mill, Barrow Ash; Broomhall Schools, Nantwich; Congregational Church, Burslem; Barnton School, Northwich; Summit Works, Walsall; Additions to Rockside Hydro, Matlock; Workhouse Infirmary, Atherstone; Union Infirmary, Boston; Science Schools, Warwick; Alvaston Schools, Derby.

New Expanded Metal Co., Ltd.

Floors, &c., Milburn House, Newcastle-on-Tyne.
Floors, &c., Pavilion and Café, Bridlington.
College Goods Station, Glasgow, for North British Railway Co.
Circular Tank at Hursley Park, near Winchester (56ft diameter, 10ft. depth of water).
Malting Store at Beamish & Crawford's Brewery, Cork (Floors, Walls, and Roof).
Settling Tank at South Hayling.
Floors, &c., Marischal College, Aberdeen.
Floors and steelwork encasing, Hull General Post Office.
Floors, Superstructure, Holborn Tube Station, London.
Concrete Domes and Corridors, Victoria and Albert Museum, South Kensington.
Cadbury's New Factory, Bournville, near Birmingham.
Public Baths, South Shields.
Public Baths, Manor Street, Chelsea, S.W.
Sea Wall at Hornsea, near Hull.
Schools, Gainsborough.
New Isolation Hospital Cheshunt.
Scunthorpe Reservoir.
New Public Baths, Shepherd's Bush.
Floors, &c., Messrs. Todd, Burns' Premises, Dublin.
Foundation Raft, New Generating Station, Blackfriars, S.E.
New Underground Electric Railway Stations.
Decking, L.C.C. Bridge, Denmark Hill, S.E.
Floors, G.E.Ry. Generating Station, Stratford.
Sewage Tanks, Greystones, Ireland.
Co-operative Bakery, Winsford.
Floors, General Post Office, Aberdeen.
Floors, North End Spinning Mill, Bolton.
Floors, Artisans' Dwellings, Kingstown.
Floors, Scottish Provident Institution, Glasgow.
Pumping Station, Chandlers Ford.
Aqueducts and Tanks, Loch Leven Water Supply.
Reservoirs: Tranmere, Birkenhead; Waterworks: Colchester; Wilford Hill, Nottingham; Cranleigh; Highbridge, and Sevenoaks.
Floors, Oak View Mills, Greenfield.
Woolwich Arsenal.
Floors, Armstrong, Whitworth & Co.'s Works, Elswick.
Floors, Strood Generating Station.
Floors, British Museum Extensions.
Floors, &c., New Offices for Messrs. Vickers, Sons and Maxim, Sheffield.
Floors, Edinburgh and Leith Gas Works, Granton and Newport Gas Works.
Floors and Roofs, Shepton Mallett, Northallerton and Gloucester Prisons.

Richard Johnson, Clapham & Morris, Ltd. (Johnson's Wire Lattice System).

Coke Oven Floors, Leeds, for Mackey-Seymour Eng. & Coke Oven Co.
Office and Warehouse Floors for Dixon & Heydorn, London and Barking.
Bridge Deck Work, Regent's Park (two more bridges to be started immediately), for H.M. Office of Works.
Deck work, Ryde Railway Pier (one bay 9ft. 4in. wide, by about three-quarters of a mile), for L. & S.W. and L.B. & S.C. joint companies.

William Cubitt & Co.

Flour Mills at Victoria Docks, London, for Vernon & Sons (Hennebique System).

L. G. Mouchel (Hennebique System).

Extension to the General Post Office, Newgate-street, London, for H.M. Office of Works. Sir Henry Tanner, architect.
New Bridge-street Goods Station, Newcastle-on-Tyne. (Roofs covered with "Ruberoid.")
Warehouse, 143, Grosvenor-road, London, for the Associated Portland Cement Manufacturers, Ltd.
Grain Warehouse, Waterford, for R. & H. Hall, Ltd.
Warehouse, Colne, for the Colne Co-operative Society.
New Stationery Offices, Royal Oak, London, for the Great Western Railway Co.
Maise Mill and Silos, Sligo.
Bridge, Stanford, for the Worcestershire County Council (96ft. span).
Grain Silos, Ipswich, for R. & W. Paul.
Goods Station, Canons Marsh, Bristol, for the Great Western Railway Co.
Factory at York, for Rowntree & Co., Ltd.
Warehouse, Dublin, for Hely & Co., Ltd.
Dyeing and Cleaning Works, Belfast, for the Monarch Cleaning Co., Ltd.
Factory at Harrow, for the Kodak Co., Ltd.
Wolseley Works, Birmingham.

Weber Steel-Concrete Chimney Co., Ltd.

The first Reinforced Concrete Chimney erected in England, at Lyle's Refinery, Victoria Docks, London (diameter of flue 20ft., height 261ft. 4in.).
Chimney at Northfleet Works of the Associated Portland Cement Manufacturers, Ltd.
Chimney at Works of Thames Paper Co., Ltd., at Purfleet, Essex.
Chimney near Adisham Kent, for the Foncage Syndicate, Ltd.

STEELWORK.

The year has not been an ordinary one as regards the use of steel in buildings, for the American system of steel-frame construction has been found advantageous and is being increasingly adopted. The Ritz Hotel, Piccadilly, the first thoroughly typical frame building in London, was completed and opened in June. The "Morning Post" building in Aldwych, London, is nearing completion; and the Waldorf Hotel in the same thoroughfare is rising rapidly. The steelwork in all three buildings was designed by Mr. S. Bylander and erected by the Waring White Building Co., Ltd. In London also Messrs. Drew-Bear, Perks & Co., the well-known steelwork contractors, were responsible for steel-frame structures—namely, Gloucester House Flats, corner of Park Lane and Piccadilly (1,400 tons of steel), Nos. 168 to 172, Piccadilly, and a building on the site of St. Philip's Church, Regent Street. This firm were also responsible for interesting steelwork in a building in Long Acre, London, girders and stanchions supporting the Hammersmith offices of the Great Northern, Piccadilly and Brompton Railway for the Underground Electric Railways Co., of London, Ltd. (the whole of this steelwork was delivered, erected and handed over in the short contract time of 12 weeks), the Aberdeen Theatre, and the new Empire Theatre, Sunderland. Messrs. D. G. Somerville & Co. have also carried out steel-frame buildings in London—namely, Messrs. Sanderson's new premises in Berners Street, and the National Telephone Co.'s exchange at Paddington. The latter has an interesting steel arched roof 38ft. span and 80ft. long. The floors and roofs are constructed throughout with Messrs. Somerville's patent system of hollow reinforced concrete tiles. This firm is also responsible for the steelwork of Chelsea Town Hall Extension (Mr. Leonard Stokes, architect).

Messrs. Measures Bros. supplied the steelwork for warehouses at Davis' Wharf, near the Tower Bridge, London.

Another interesting job was the extension of the Queen's Hotel, Birmingham, carried on a new form of cantilever over the platform of New Street Station; this was illustrated in our issue for September 5th.

The first steel-frame building in Edinburgh is in course of erection in Princes Street. Mr. J. J. Burnet, F.R.I.B.A., is the architect.

Another important steel-frame building is the College Goods Station at Glasgow for the North British Railway Co. Messrs. R. McAlpine & Sons were the general contractors. Over 60,000 sq. yds. of expanded steel concrete flooring at two levels are to be found in this building.

Messrs. E. F. Blakeley & Co., of Vauxhall Ironworks, Liverpool, have been very busy throughout the year in the erection of steel buildings, roof principals, churches, &c. They have completed a steel frame and concrete building for Messrs. G. H. Lee & Co., Basnett Street, Liverpool (Messrs. Matear and Simon, architects); also steelwork extensions have been carried out for Messrs. Lever Bros., Ltd., Port Sunlight (Messrs. Wm. and Segar Owen, architects); the Wolverhampton Corrugated Iron Co., Ltd., at Ellesmere Port; electric car sheds at Swinton (Messrs. Matear and Simon, architects); the new grand stand for the Liverpool Football Club (Mr. Archibald Leitch, architect); and churches at Birmingham, Horwich, Blackley, Wallasey, &c.

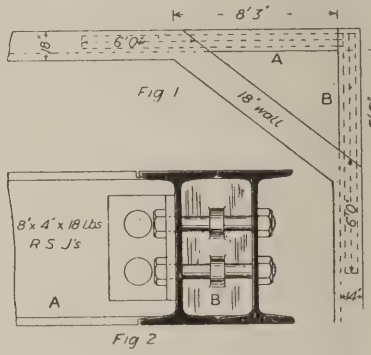
Messrs. Power's and Deane Ransome's Ltd., carried out the steel frame for new printing works at Aylesbury (W. Ernest Hazell, A.R.I.B.A., architect).

The whole of the steelwork for the works of the New Enfield Cycle Co., Ltd., at Redditch and the Adams Manufacturing Co., Ltd., at Beaford, has been carried out by the St. Pancras Iron Works Co., Ltd. The firm have erected steel roofs for the Borough of Devonport, the Western Electric Co. at North Woolwich, the London County Council at the Streatham car sheds, at Banstead Asylum, and at Radcliffe Infirmary, Oxford. They have constructed spiral staircases, air uptakes, inlets and outlets to fans, &c., for the Underground Electric Railways Co. of London, Ltd., and staircases on the City and South London Railways extension. The St. Pancras Ironworks have also erected fire escape staircases at Metropolitan and City Police Orphanage, Strawberry Hill, Hackney New Infirmary, Stock Exchange, Stoke-on-Trent Workhouse, Sheffield Union Infirmary, Portsmouth Union Infirmary, St. Bartholomew's Hospital, Greycoat Hospital, Westminster, Rowton Houses, King's Cross, London, City of London Lying-in Hospital, Lever Bros., Ltd., Works, Port Sunlight, Imperial Tobacco Co. (Gt. Britain), Ltd., Works at Bristol, and at various London houses.

Enquiries Answered.

Joists to Carry Projecting Brickwork.

Wellingborough.—F. writes: "The accompanying sketch shows a splay corner in a building 35ft. high to eaves. From a height of 25ft. to the top this corner has to be brought out square (as indicated by broken line). Up to 25ft. high is an 18-in.



wall and above that height a 14-in. wall. The wall A is the end wall of the building with a gable end for roof of 8ft. 4ins. pitch. No roof principals will rest on the walls. I propose carrying out this corner on two steel joists, depending on the weight on the back portion of the joists to hold up the corner; the joists to be 18ft. long, 9ins. × 7ins. × 54lbs. It is not possible to get a vertical support at *b*, as a railway siding runs underneath. Is this sound construction?"

The accompanying sketch, Fig. 1, shows the plan of walls, the projecting shaded portions on first floor having to be carried on projecting rolled joists. Taking the 14-in. walls as, say, 12ft. mean height, the weight of wall $a = \frac{7\cdot5 \times 12 \times 1\cdot125}{20} =$ 5 tons, giving a bending moment of $\frac{\text{WL}}{2} = \frac{5 \times 7\cdot5}{2} = 18\cdot75$ ton-ft., or a tabular value of $18\cdot75 \times 8 = 150$, the nearest sections being two (B.S.B.15) 9ins. by 4ins. by 21lbs. steel joists. The weight of wall $b = \frac{7 \times 12 \times 1\cdot125}{20} = 4\cdot72$ tons, giving a bending moment of $\frac{\text{WL}}{2} = \frac{4\cdot72 \times 7}{2} =$

16·52 ton-ft., the tabular value will then be 16·52×8=132, requiring two (B.S.B. 11) 8-in. by 4-in. by 18-lb. steel joists. As each joist of this size has a tabular value of 70, or 140 for the pair, using all four this size would give 2×140=280, against the requirements of 150+132=282, which is practically identical. Therefore, the joists will be 8ins. by 4ins. by 18lbs., and must be carried back not less than 6ft. into each wall, as shown in Fig. 1. The joint between the pairs of joists A and B will be as shown in Fig. 2.

HENRY ADAMS.

Thrust from Chancel and Nave Arches.

OLD SUBSCRIBER writes:—"Referring to the accompanying illustration, I shall be glad to know whether there is sufficient abutment on each side of the chancel arch to enable it to support the weight of the tower above without fear of settlement. Is sufficient abutment provided for the nave arches to prevent settlement?"

Fig. 1 shows half elevation and Fig. 2 half plan of chancel arch and abutment. The loads above from tower, &c., are marked on the assumed voussoirs, and the line of thrust is shown by stroke-and-dot line as obtained from Fig. 3. The maximum thrust in the arch reaches about 25½ tons per sq. ft., which is rather high, but this is the maximum possible, and the efficiency of bonding in the work above it may reduce the natural load. Combining the thrust with weight of abutment gives a final resultant nearly in the centre of the foundations, but causes a load of about 5 tons per sq. ft. above the footings. Fig. 4 shows half elevation of the adjoining nave arch with thrust line obtained from Fig. 5. The maximum thrust will be about 12 tons per sq. ft. It will be observed that the buttress has been increased in projection by 1ft. 6ins., which will then leave the maximum pressure on top of the footings 7¼ tons per sq. ft. compression at outer edge.

HENRY ADAMS.

"Sticky" Paint; Compensation for Drain Laying.

LONDON.—A. P. H. writes: "(1) What is the cause of 'sticky' paint? I know of internal paint-work, done six years ago, which is still 'sticky.' (2) On complaint from a tenant a landlord finds it necessary to relay drains which run through a shop. About 12 or 18 months of the agreement remain to run. Can tenant claim compensation for inconvenience during work? The property is to be pulled down for rebuilding immediately after the tenancy expires. It appears to me that the landlord has no alternative but to do the work (to buy the tenant out would cost more than the work), although he has not covenanted to do so. Is that the legal position?"

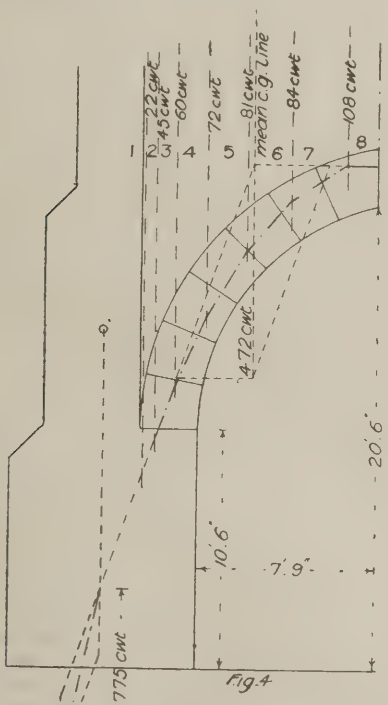


Fig. 4

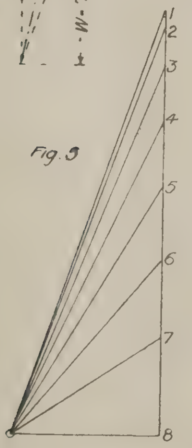

Fig. 5

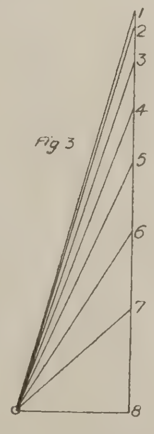

Fig 3

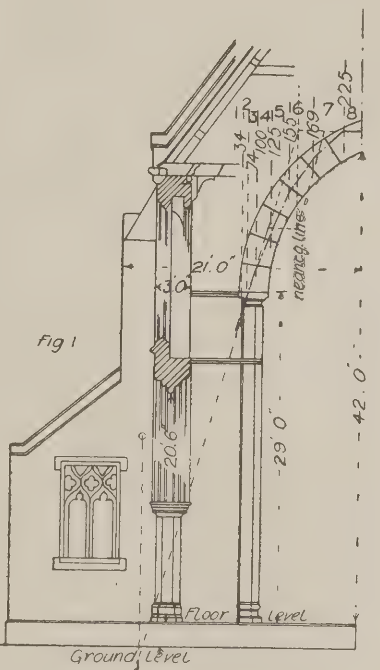

Fig 1

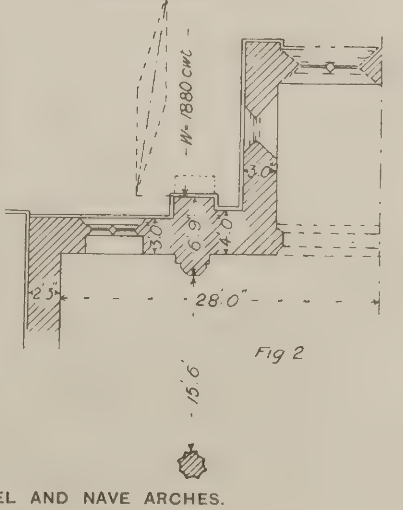

Fig 2

THRUST FROM CHANCEL AND NAVE ARCHES.

(1) The use of bad oil or varnish, non-drying oils being used as substitutes.

(2) We should think not, but the question will turn on the terms of the agreement. Usually there is a clause giving the landlord power to enter and effect all necessary repairs.

Book on Boiler-making.

RUNCORN.—ANXIOUS writes: "Kindly name a good book dealing with practical boiler-making. I may say that I am in possession of one called 'Plating and Boiler-making' by a foreman pattern-maker, but I want something dealing more with the marking-out of work."

Sexton's "Pocket-Book for Boiler-Makers and Steam Users" (E. & F. N. Spon) would probably meet the case.

Views and Reviews.

Hudson's Building Contracts.

We have received Vol. II. (the first vol. will be ready next month) of the above work, containing the reports and precedents. It is almost needless to refer at length to a work which is regarded as a standard authority on this vexed and complicated branch of English Law. In the recent ruling cases reported in this particular volume the disputes seem to have arisen in most instances from discrepancies between drawings, quantities and specification, and in some cases these errors have worked hardly on the contractors, who have been debarred by one of the usual stringent clauses from any remedy. Of course, in the case of many engineering contracts it is an impossibility to give absolute and precise information before the ground is opened and the site is fully disclosed. In the case of *Pearson versus the Dublin Corporation*, the well-known firm of contractors sought to recover damages for loss sustained by fraudulent misrepresentation of the character of a certain existing wall which was to be utilised in the new sewage outfall works at Dublin for which they had contracted. The work proposed was the conversion of an old harbour at the mouth of the Liffey, which had on one side an existing sea-wall some 900ft. long (shown by dotted lines on the engineer's plans to go down 9ft. below ordnance datum), into a dry basin for the reception of sewage tanks, &c. It was essential to the scheme that the wall shown should extend to the depth indicated, so that it was watertight, and the plaintiffs accepted the engineer's plans on this point apparently without question. After closing the harbour mouth with a coffer-dam the plaintiffs found the water pouring under the wall, which practically rested in the surface of the mud. The whole scheme had, therefore, to be revised. The plaintiffs, however, failed to prove the misrepresentation or to get over the stingency of clause 43 of the conditions, which threw all the responsibility, for ascertaining the nature and extent of the existing works, upon them. Another interesting case is that of *Geary, Walker & Co. versus Lawrence & Son*, which turns upon the terms of payment in contracts between a general contractor and his sub-contractors.

The Law of Building, Engineering, and Ship Building Contracts, and of the duties and liabilities of Engineers, Architects, Surveyors, and Valuers; with precedents and reports of cases. By Alfred A. Hudson, of the Inner Temple, Barrister-at-Law. Third edition. 1907. London: Sweet & Maxwell, Ltd., 3, Chancery-lane. Two vols £2 12s. 6d. the two.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Dec. 28. Warwick.—*Erection of a workshed at* the Workhouse, Warwick, according to plan and specification, which may be seen at the office of F. P. Trepess, F.I.A.S., 1, Church Street, Warwick, any day (except Saturday) between 10 a.m. and 4 p.m. Tenders, sealed and endorsed "Tender for Workshed," addressed to C. H. Passman, clerk to the Guardians, 48, Bedford Street, Leamington Spa, must be delivered not later than 9 a.m. on Dec. 28.

Dec. 31. Edinburgh.—*Executing the following works*, in connection with the extension of Tower Bank School, Portobello:—1. Mason and Brick Works. 2. Carpenter and Joiner Works. 3. Smith Work. 4. Slater Work. 5. Plaster and Cement Works. 6. Plumber Work. 7. Painter Work. Plans and specifications may be seen, and schedules and measurements may be obtained at the office of Mr Carfrae, architect, 3, Queen-street. Estimates, marked outside "Estimates for ——— Work for Tower Bank School," to be sent to G. W. Alexander, clerk to the board, School Board Offices, Castle Terrace, Edinburgh, not later than Dec. 31.

Jan. 1. Ruthin.—*Erection of new County Offices* to be erected at Ruthin. Builders desirous of tendering are requested to forward their names, together with a deposit of £1 1s. to the County Architect and Surveyor, W. D. Wiles, 42a, High-street, Wrexham, on or before Jan. 1.

Jan. 4. London, S.E.—*Enlargement of the Sorting Office* at Catford, S.E., for the Commissioners of H.M. Works. Drawings, specification, and a copy of the conditions and form of contract may be seen on application to J. Wager, H.M. Office of Works, S.W. Bills of quantities and forms of tender may be obtained on payment of £1 1s. Tenders must be delivered before 12 o'clock noon on Jan. 4, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed "Tender for Catford Sorting Office Enlargement."

Jan. 7. Hartlepool.—*Erection of about 104 lineal yards* of 9-in. brick boundary wall, with piers, at Holy Trinity Churchyard, Seaton Carew, in accordance with plans and specification to be seen, and further particulars to be obtained upon application to N. F. Dennis, A.M.Inst., C.E., borough engineer, Municipal Buildings. Tenders, endorsed "Boundary Wall," and addressed to the Chairman of the Property and Lighting Committee, are to be delivered at the Town Clerk's office, 78, Church-street, not later than 4 p.m. on Jan. 7.

Jan. 7. Hornchurch.—*Erection and completion of a fire station*, with works incidental thereto, in Billet-lane, Hornchurch, for the Town Council. The plans and specification may be seen and forms of tender obtained between the hours of 10 a.m. and 5 p.m., and on Saturday 10 a.m. and 1 p.m., of E. J. Little, architect, Longfield Gardens, Hornchurch-road, Romford. Sealed tenders, endorsed "Tender for Fire Station," are to be sent to R. G. Ward, chairman, Hornchurch Parish Council, Hornchurch, not later than 12 o'clock (noon) on Jan. 7.

Jan. 9. Landport.—*Erection of* a store at the factory of Doudney & Co., Ltd., soap manufacturers, Landport. Specifications, plans, and quantities to be seen of Cook & Tutte, architects, 394, Commercial-road. Sealed tenders to be sent by Jan. 9 to 333, Commercial-road, the registered offices of Doudney & Co., Ltd.

Jan. 9. Margate.—*Erection of Laundrymaids' Quarters* at East Cliff House, Cliftonville, Margate, in accordance with drawings and specification prepared by W. T. Hatch, M.Inst.C.E., M.I.Mech.E., Engineer-in-Chief. Drawings, specification, conditions of contract, and form of tender may be inspected at the Office of the Board, Embankment, London, E.C., and can then be delivered at the office of the Board not later than obtained upon payment of a deposit of £1. Tenders, addressed as noted on the form, must be 10 a.m. on Jan. 9.

Jan. 10. Stewarton.—(1) *Digger, brick, and mason works* in One Contract; (2) Carpenter and joiner works; (3) Slater and plumber works in connection with keeper's house, &c. (4) Plaster, cement, and rough cast works; and (5) Drainage, levelling, and road making, at Stewarton Cemetery. Plans and specifications may be seen at the Parish Council Office, Stewarton, or at the office of J and J. Armour, architects, Irvine. Schedules of measurement can be obtained from the architects on the deposit of £1 sterling. Sealed offers, marked "Offer for Cemetery," to be lodged with J. Kerr, F.S.A.A., clerk to the Parish Council, Parish Council Office, Stewarton, on or before Jan. 10.

Jan. 11. Reading.—*Erection of a new school* for 250 scholars at Swallowfield, Berks. Builders desirous of tendering are required to send in their names to the Secretary to the Education Committee, The Forbury, Reading, on or before Jan. 2, together with a deposit of £3 3s. for bills of quantities, which will be supplied by post. Plans, specification, and form of contract will be open for inspection at the Education Secretary's Office between the hours of 10 and 5. Tenders must be delivered at the office of the Education Secretary, on the form and in the envelope provided, not later than the first post on Jan. 11.

Jan. 14. Winchester.—(1) *The erection of a new school* at Totton; (2) the installation of low pressure hot water apparatus therein. Plans, specification, and conditions of contract may be seen, and bills of quantities obtained, at the office of W. J. Taylor, County Surveyor, The Castle, Winchester, between the hours of 9 a.m. and 5 p.m. (Saturdays 9 a.m. and 1 p.m.). A deposit of £2 2s. will be required for a copy of the bills of quantities for estimate (1). A similar deposit will also be required for a copy of the specification for estimate (2). Deposits must be made by cheque payable to Hants County Council and crossed Bank of England, or particulars will not be sent. Tenders, endorsed "Council School, Totton," are to be delivered to H. Barber, clerk of the County Council, The Castle, Winchester, by 10 a.m. on Jan. 14.

No Date. Ramsbottom.—*Erection of a weaving shed* at Stubbins Vale, Ramsbottom. Quantities will be sent, on deposit of £1 1s., on application to Moulds & Porritt, Victoria-buildings, Bury.

No Date. Winterton.—*Erection of three almshouses* at Winterton, Lincolnshire, for the Trustees of the late Mrs. M. Clarke. Plans may be seen at the Vicarage, Winterton, and bills of quantities obtained from Joy, Cross, & Son, solicitors, Barton-on-Humber.

ENGINEERING.

Dec. 27. Newport, I.W.—*Extension of the quay wall* on the quay at Newport, I.W. Plans may be seen and specifications and form of tender may be obtained on application at the Town Clerk's Office, 19, Quay-street, Newport. Sealed tenders, endorsed "Tender for Extension of Quay," to be delivered to T. R. Pratt, town clerk, not later than 10 o'clock a.m. on Dec. 27.

Dec. 27. London, S.W.—*Supply and fixing of electrically-driven screens* at their Pumping Stations, Durnsford-road and Kingston-road, Raynes Park, for the Corporation. Specification and form of tender may be obtained on application to the Borough Engineer, Town Hall, Wimbledon. Sealed tenders, on forms and enclosed in envelopes provided, to be delivered at the Town Hall on or before noon on Dec. 27.

Dec. 28. Widnes.—*Erection of an engine* and boiler house for the Corporation Waterworks, at their Stockswell Pumping Station. Copies of specification, conditions of contract, and bill of quantities may be obtained and the plans inspected on application to the Water Engineer, Widnes, and on payment of £2 2s. Tenders, endorsed "Engine and Boiler House," must be addressed to the Chairman of the Gas and Water Committee and delivered at the Town Hall, Widnes, on or before noon on Dec. 28.

Dec. 28. Dublin.—*Supply of 320yds. of wrought-iron railings* to enclose Recreation Ground at Dollymount, for the Improvements Committee. The railing are to be made and supplied in 6-ft. sections, having round iron bars passed through horizontal bars and rivetted underneath, in accordance with the design prepared by the City Engineer, copy of which, with a full memorandum of particulars, can be had on application to P. Tobin, secretary, any day between 11 and 4; Saturdays 11 and 1. Tenders, addressed to the Chairman, Improvements Committee, City Hall, and endorsed "Tender for Wrought-Iron Railings," must be received by the Secretary not later than Dec. 28, at or before 12 noon. Fair wages clause. The railings shall be of Irish manufacture.

Dec. 29. Melton Mowbray.—*Construction of a girder bridge*, with brick abutments, iron palisading, and road metalling, &c., complete, over the Scalford Brook, from Regent Street to Brook Street, for the U.D.C. Plans and specifications may be seen at the office of E. Jeeves, surveyor to the Council, Nottingham Street, Melton Mowbray, and applications for quantities and particulars of tendering must be sent to him not later than Dec. 29.

Dec. 31. Guildford.—*Supply of a new boiler and* heating apparatus, at the Public Baths. A plan and specification may be seen and forms of tender obtained on application to C. G. Mason, C.E., borough surveyor. Sealed tenders, endorsed "Tender for Heating Apparatus," are to be sent to F. S. Miller, town clerk, Town Clerk's Office, Bridge-street, Guildford, on or before Dec. 31, by 12 noon.

Dec. 31. Brackley.—*Sinking a well* in the Borough of Brackley. Specification and forms of tender may be obtained and plans seen at the office of the Town Clerk at Brackley, and information and any further particulars may be obtained on application to J. Eunson, C.E., Northampton. Copies of specification may be obtained on payment of £2. Tenders, upon the forms supplied, must be delivered not later than 10 a.m. on Dec. 31, addressed to C. E. Barnes, town clerk, endorsed "Tender for Well."

Jan. 2. Manchester.—*Strengthening of the Ashton Old Road Bridge*, over the Ashton Canal, and for repairs to Fairfield-street and Sackville-street Bridges over the River Medlock. Drawing may be seen and specification, bill of quantities, and form of tender obtained on application to the City Surveyor's Office, Town Hall, Manchester, on payment to the City Treasurer of £2 2s. All cheques or postal orders are to be made payable to the order of "The Corporation of Manchester." Tenders, enclosed in the official envelope, and addressed to the Chairman of the Paving, &c., Committee, to be delivered at the City Surveyor's Office not later than 10 a.m. on Jan. 2.

Jan. 3. York.—*Construction of the Selby and Goole Railway*, about 10 miles in length, for the North-Eastern Railway. The works comprise double-line railways chiefly on embankment (upwards of 1,000,000 cubic yards), with stations, station yards, warehouses, cottages, and other buildings, sidings, and bridges. The steelwork of the latter will amount to about 1,100 tons. Plans may be seen, and specification, detailed quantities, and form of tender obtained, on personal application at the office of W. J. Cudworth, Company's engineer, York. Sealed tenders, marked "Tender for Selby and Goole Railway," to be addressed to R. F. Dunnell, secretary, and delivered at his office at York not later than noon on Jan. 3.

Jan. 7. York.—*Construction of a group of carriage sidings* (about four miles in length) at Scarborough, on the west side of the Scarborough and Whitby Railway, for the Directors of the North-Eastern Railway. Plans may be seen and specification, detailed quantities, and form of tender obtained on personal application only at the office of W. J. Cudworth, company's engineer, York. Sealed tenders, marked "Tender for Carriage Sidings, Scarborough," to be sent to the Secretary at York not later than noon on Jan. 7.

Jan. 9. Worthing.—*Sinking a well* 115ft. deep, lined with iron cylinders, and the driving of headings and other works in connection therewith, for the Corporation. Plan and specification may be seen and form of tender obtained on application to F. Roberts, A.M Inst.C.E., borough water engineer and surveyor. Sealed tenders, endorsed "Tender for Well," to be sent in to W. Verrall, town clerk, Municipal Offices, Liverpool Road, Worthing, not later than 12 noon on Jan. 9.

Jan. 10. Swansea.—*A two-ton portable high pedestal* hydraulic crane with a radius of 40ft., for the Swansea Harbour Trustees. Further particulars can be obtained on application to A. O. Schenk, Mem.Inst.C.E., Trustees' engineer, at the Harbour Offices, Swansea. Tenders, sealed and marked "Hydraulic Crane," should be delivered to T. Strick, clerk, Harbour Offices, before 10 a.m. on Jan. 10.

Jan. 30. Penllwyn.—*Supplying and erecting* the steel and iron work of the proposed Rhiwarthen Bridge over the Rheidol. Plans and specifications can be seen at the office of H. Hughes, clerk to the District Council, Aberystwyth. Tenders to be sent to R. Adams, secretary to the Joint Committee, Penllwyn, Aberystwyth, on or before Jan. 30.

IRON AND STEEL.

Jan. 5. Winton.—*Erection of latrines and fencing* (wrought iron and wood) at the New Recreation Ground, Sutherland-street, Winton, for the Parks, &c., Committee of the Borough of Eccles. Plans and specifications may be seen at the office of the Borough Surveyor, where bills of quantities may also be obtained on deposit of £1 1s. Tenders must be accompanied by a fully priced out schedule, and must be made out on an official envelope which will be supplied. Sealed tenders, properly endorsed, must be left at the office of E. Parkes, town clerk, Eccles, by noon on Jan. 5.

Jan. 7. Beckenham.—*Supply of about 250 lin. yds.* of W. I. unclimbable fencing, 6ft. high, together with ornamental entrance gates, for the U.D.C. Specifications and forms of tender obtained on application to J. A. Angell, surveyor, on the production of a receipt from the Collector (who attends his office daily from 9 to 10 a.m. only, except on Tuesdays, when his hours are from 9 a.m. to 1 p.m.), for a deposit of £1. Tenders, duly sealed and endorsed "Tenders for Railings and Gates," to reach F. Stevens, clerk to the Council, not later than 4 p.m. on Jan. 7.

PAINTING AND PLUMBING.

Jan. 2. Pendoylan.—*Re-painting the iron bridge* across the River Ely near Duffryn Mawr, Pendoylan. Specification can be seen of J. Holden, A.M.I.C.E., surveyor, 20, Park Place, Cardiff. Tenders to be sent to M. Warren, clerk to the Council, Park House, Cardiff, not later than 12 o'clock noon on Jan. 2.

ROADS AND CARTAGE.

Dec. 27. Burslem.—*Making-up of Back Tellwright-street*, under the Private Street Works Act, 1892. Plan and specification can be seen, and quantities obtained, at the Borough Surveyor's Office, Queen-street, on payment of £2 2s. Fair wages clause. Sealed tenders, endorsed "Private Streets," to be sent to A. Ellis, town clerk, Town Hall, Burslem, not later than 10 a.m. on Dec. 27.

Jan. 3. Luton.—*Paving and doing other works* of private improvement in Clarendon-road and Ridgeway-road in accordance with the plans and specifications prepared by the Borough Surveyor and to be seen at his office at the Town Hall, Luton Separate tenders for each street to be received by G. Sell, town clerk, Town Hall, Luton, by four o'clock p.m. on Jan. 3.

STRUCTURAL STEELWORK

Can you Design your own Steelwork? Do you know how to properly proportion your columns, stanchions, and girders? We guarantee to teach you how to do this in a few lessons by our System of Correspondence Tuition in Architectural Steelwork.—Apply to us for free Booklet J (4th edition), MIDLAND ENGINEERING BUREAU, Strand, Derby.

PRACTICAL DESIGNING of STEEL CONSTRUCTIONAL WORK taught by Correspondence, individually or in classes. Elementary and advanced courses arranged for Architects, Engineers, &c. Write for Prospectus B., EMBANKMENT ENGINEERING INSTITUTE, 156, Temple Chambers, Temple Avenue, E.C.

Situations

are always hard to get, and no one realises this more than men who are out of a berth.

If you are at the present time **Seeking a Situation** or if you wish to better your present position you owe it to yourself to neglect no opportunity of obtaining a berth which offers itself.

THE "BUILDERS' JOURNAL" EMPLOYMENT REGISTER

offers you exceptional facilities for making your requirements widely known.

Those who have used our columns when advertising for fresh berths have expressed the greatest satisfaction at the results they have obtained, and we append a letter received from one of them:—

> "Kindly remove my name from your Employment Register. I am glad to say I have obtained a berth through its agency, for which I am obliged to you."

Every week—we might say every day—we get fresh evidence that employers consult the "Builders' Journal" Employment Register, and appended are a **selection from the letters received lately.**

> "Kindly put advertisers Nos. 2187, 2215 and 2229 into communication with us and oblige."
> From a well-known firm of *Provincial Architects*

> "Kindly instruct Nos. 1921, 1948, 1956, 1990-2002, 2021, 2024. 2042 and 2044 to send us particulars of wages required and qualifications, &c."
> From a *Builder & Contractor.*

> "Please put me into communication with advertiser No. 2182, Clerk of Works and Draughtsman,"
> Writes a *Prominent Architect.*

> "Please ask No. 2099 to forward references stating capabilities and wages required."
> From a *Somersetshire Builder & Contractor*

The above letters speak for themselves, and it only remains for you to give the Employment Register a trial, and below we give full particulars of the cost of making your requirements known.

For 3s. we give three insertions (in a four-line advertisement) in our "Appointments Wanted" Columns, and also 6 insertions in the "EMPLOYMENT REGISTER" (see page l).

VOLUMES I. to XXI. of
THE BUILDERS' JOURNAL
Handsomely bound in cloth gilt 7/- each.
